1. Roles and responsibilities

- The key roles involved in the lifecycle.
- Who is responsible for development, technical approval, deployment, operation, monitoring and risk management.
- How responsibilities are communicated and understood.
- What competencies are required for each role and how we make sure each person assigned to a specific role has the required level of competency.

Supporting evidence could include role descriptions, workday profiles, a RACI matrix, project documentation.

2. AI risk and impact assessment.

- Complete AI Intake Assessment - not submitted currently
- Describe the main AI risks associated with the system from Artefact 2.
- Explain how risks are identified and rated.
- Show the current AI Risk and Impact Assessment (artefact 2)
- Identify risk owners and agreed treatment actions.
- Explain how outputs from the impact assessment are transferred into the risk management process.
- Demonstrate how risks are reviewed when the system, data, intended use or operating environment changes.

Please review the risks documented in Artefact 2, and on OneTrust (when AI Intake assessment is submitted). Ensure any mitigations are suitable and remove those which are not.

3. AI and data lifecycle management

- The lifecycle stages for the system.
- Activities, reviews and approvals required at each stage.
- The sources and types of data used.
- How data quality, suitability, provenance and access are managed.
- How testing and validation are performed.
- How the system is deployed and monitored.
- How lifecycle records are maintained.
- How significant changes trigger further review, testing or assessment.

5. AI techniques

- What AI techniques or models are used.
- Why those techniques were considered appropriate for the intended purpose.
- Whether any pre-trained models, external components or third-party services are involved.
- How the techniques were tested and validated.
- The limitations, assumptions and known failure modes.
- How performance is monitored after deployment.
- What would trigger retraining, reconfiguration, replacement or withdrawal.

6. Change management

The auditor is expected to select one or more changes and trace them through the change management process.

The team should have a representative sample available showing:

1. The change was requested and described.
2. Its technical and operational impact was assessed.
3. AI, data, security and customer risks were considered.
4. Testing and validation were completed.
5. The change was appropriately approved.
6. Deployment was controlled.
7. Relevant documentation was updated.
8. Post-implementation monitoring or review was performed.

The selected example should be complete and easy to follow across the relevant tickets, pull requests, test results, approvals, release records and updated documentation.

7. Technical documentation

- System architecture and component descriptions including diagrams.
- Model or AI technique documentation.
- Data flows and data sources.
- Interfaces and dependencies.
- Testing and validation records.
- Deployment and release documentation.
- Operational procedures and support information.
- Monitoring arrangements.
- Known limitations and assumptions.
- Version history and document ownership.

Any documentation should reflect the current version of the system. Please ensure versioning and dates are consistent across documents intended to be shown.

7. Incident management and communication

- What would constitute an AI-related incident.
- How team members report concerns.
- Who owns triage and escalation.
- How customers and other stakeholders would be informed.
- How incidents are recorded, investigated and resolved.
- How lessons learned are incorporated into risk assessments, controls and lifecycle documentation.

Examples could include unexpected outputs, performance degradation, inappropriate use, data issues, security events or failures affecting customers.

8. Awareness interviews

The auditor may use the product session as an "awareness interview". Please ensure all people involved in the sessions are of:

- Their role in the AI lifecycle.
- Relevant AI risks and controls.
- How to raise a risk, concern or incident
- Where to find applicable policies and procedures (Employee Hub or AI Delivery page).
- Kainos AI Awareness Training (ensure all users have completed this)
- Kainos AI Policy

Recommended evidence pack

- System description and architecture (Artefact 1).
- Roles and responsibilities or RACI.
- AI Intake Assessment
- AI Risk and Impact Assessment (Artefact 2).
- Data management and lifecycle records (Artefact 3).
- Technical documentation.
- Testing and validation evidence.
- Change management sample.
- Release and approval records.
- Monitoring records and defined thresholds (Artefact 4).

  Incident management guidance (if exists, otherwise Kainos normal SIR process).

- Competence and training evidence of team (AI Awareness Training)
