1.1 Problem Statement

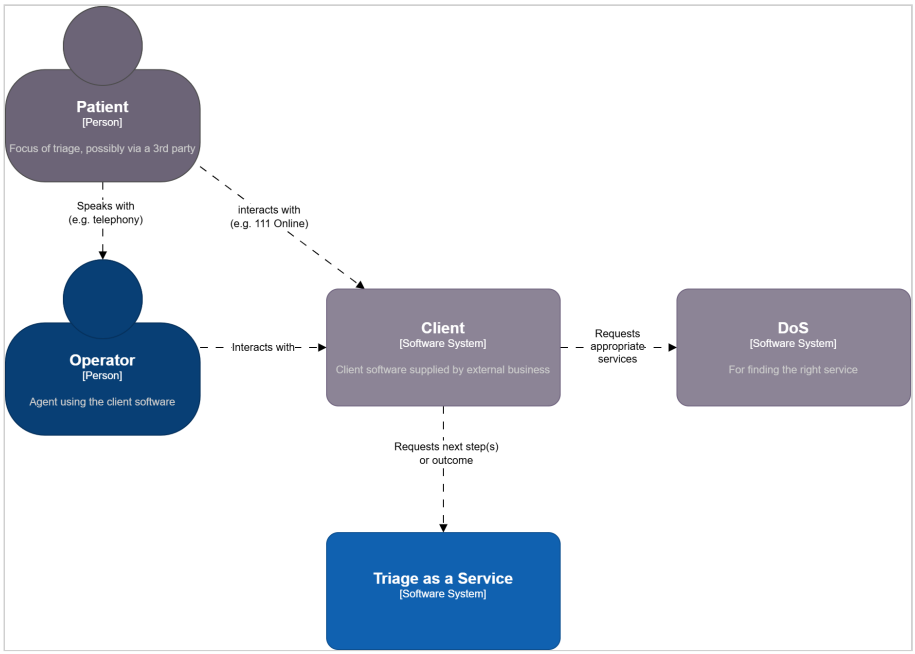

Where the Pathways triage engine is hosted centrally, instead of having to be implemented by supplied software, we seek understanding and agreement on if FHIR is the most appropriate communication format for performing triages.

1.2 Design Proposal

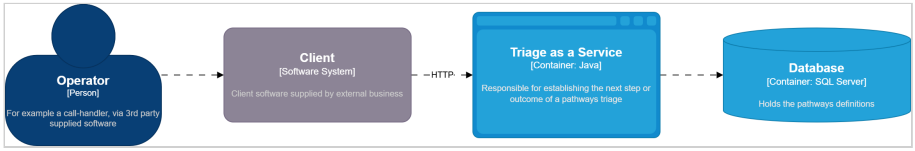

Business		Responsible (RACI)
Business Change	*N/A as this is a PoC and will not impact current business processes.*	Business Analyst (R)
High Level User Experience	1. A triage is initiated by an upstream service sending an HTTP message providing the skill-set of the handler and basic demographics of the patient (age, sex, and party). Note that the patient's location is not needed, but upstream services are expected to continue to gather that information for later, in case it is needed. 2. The system derives the initial pathway to use from these data and presents the first question back to the upstream service in response. 3. The triage is continued by the upstream service presenting that question to the patient, collecting the answer, and sending an HTTP message to the system with all of the previous data (skill-set and demographics) plus a reference to the question already asked and its answer. 4. The system is stateless, and questions can appear in multiple pathways, so it replays what it did for the opening request to work out which pathway is needed, but then instead of asking the first question again it sees that an answer has been supplied and automatically follows the pathway to its next configured question and supplies that. 5. The triage continues with this loop, with each request supplying all of the questions and answers relayed so far to the patient. 6. The system may supply: zero or one questions, which may in a special case be the body map; any number of care advice items; zero or one outcomes.	Lead Designer (R)

1.3 Custom JSON request response approach

This approach does not rely on any particular interoperability technology beyond the well-known JSON format. In practice this could also be used with XML or other common formats.

1.3.1 Requests

We need to communicate:

- The version of Pathways we want to use (to any level of specificity)
- The skillset of the operator consuming Pathways
- Whether or not the person in contact with the operator is different from the patient
- Details about the patient
    - Sex
    - Age
- Answers to any questions already put to the patient
    - Including body map

1.3.1.1 Starting a triage

- We need to be able to distinguish between the different channels and skillsets in order to determine the appropriate transfer code (T1 ... T4). This can be achieved through the `.skillset` field set to any value from `tblSkillsets.SkillsetDescription`.
- We need to know if the patient is contacting the Pathways provider directly or if an intermediary has done so on their behalf. This can be achieved with the optional `.intermediary` boolean field, whose absence implies false.
- We need details of the patient. This can be achieved with the `.patient` field, holding `.sex` and `.age` subfields.
- We need to know which version of Pathways the client wants to consume. This can be achieved with the `.version` field, which can be specified to any level of precision. E.g., if Pathways publishes a release plan such that major updates requiring training always go into an incremented first version number (e.g. 48.x to 49.x), then a client might ask for the latest of `"version": "48"`. Or mid-triage, they want to specifically continue with whichever version the triage was started with and specify `"version": "48.2.24-ae40d02"`.
- We need to know that we are starting a triage. This can be achieved by omitting the `.triage` field, or by leaving it as an empty object (i.e., `{}`)

Example 1: RQ1

```
{
  "version": "48.2.0",
  "client": {
    "skillset": "111 Call Handler"
  },
  "intermediary": true,
  "patient": {
    "sex": "female",
    "age": 35
  }
}
```

1.3.1.2 Continuing a triage

- We need to supply all of the information that was used to start the triage. We expect only the version might be different, and then only to be more specific. There is a risk that jumping between versions could mean we assume an answer would be the same when the wording of a question changed.
- We need to know what answers the patient has already provided. This can be achieved with the `.triage` field, which is a map of question identifiers to answer numbers.

Example 2: RQ2

```
{
  "version": "48.2.0",
  "client": {
    "skillset": "111 Call Handler"
  },
  "patient": {
    "sex": "female",
    "age": 35
  },
  "intermediary": true,
  "triage": {
    "TX220074": "7"
  }
}
```

Example 3: RQ3

```
{
  "version": "48.2.0",
  "client": {
    "skillset": "111 Call Handler"
  },
  "intermediary": true,
  "patient": {
    "sex": "female",
    "age": 35
  },
  "triage": {
    "TX22074": "7",
    "TX225775": "3",
    "TX130011": "4",
    "TX61025": "3",
    "TX223440": "7",
    "TX220032": "4",
    "TX223142": "1",
    "ClinicalArea": "8",
    "TX222984": "6",
    "TX222985": "1",
    "TX220667": "2",
    "TX220668": "1",
    "TX220664": "3",
    "TX220998": "1"
  }
}
```

1.3.1.3 Schema

Field	Card.	Type	Description	Provenance
`version`	1	String	The version of Pathways the client wants to consume.	Either manual configuration of the client, or through discovery if we add a `/versions` endpoint.
`client`	1	Object	Details about the client system.	The client.
`.skillset`	1	String	The skillset of the operator / client.	Either manual configuration of the client, or through discovery if we add a `/skillsets` endpoint.
`intermediary`	0..1	Boolean	Indicates if the triage is being done through a 3rd party. Assumed false if absent.	As stated by the contact.
`patient`	1	Object	Details about the patient.	As given by the contact.
`.sex`	1	String	Specifically sex as determined at birth; "male" or "female".	As given by the contact.
`.age`	1	Integer	Number of years old the patient is.	As given by the contact.
`triage`	0..1	Map	A record of the questions already answered.	The triage process.

Field	Card.	Type	Description	Provenance
`.[key:]`	*	String	The ID of the question answered.	System responses.
`.[:value]`	*	String	The ID of the answer selected.	System responses.

1.3.2 Responses

We need to communicate:

- The version of Pathways used (maximum specificity) (1)
- Details about the outcome, if one has been reached (0..1)
  - Symptom group, code and description
  - Symptom discriminator, code and description
  - Disposition, code and description
- Details about any new care advice, codes and descriptions (0..*)
- The next question, if triage hasn't finished (0..1)
  - code
  - text
  - hint
  - all answers, code, text and any hints

1.3.2.1 Progressing a triage

- We need to communicate that the triage is not complete and the client should continue to supply more information. This can be achieved by the presence of a `.question` field.
- We may need to communicate any number of care advice items. This can be achieved with the `.careAdvice` field, a map of Cx codes to presentation text.
- We may need to communicate an outcome, even though more questions can be asked. This can be achieved with the `.outcome` field, containing separate fields for SG, SD, and Dx.

Example 4: RS1

```
{
  "version": "48.2.0",
  "question": {
    "code": "TX220074",
    "text": "What is the reason for the contact?",
    "hint": "To find out the reason for the contact and where to direct it.",
    "answers": [
      {
        "code": "1",
        "text": "an injury or other health problem",
        "hint": "This means a new health problem or any existing problem that has
worsened.\nAn increase in the use of medication may hide an existing problem that is
worsening.\nThis means an individual who has swallowed or breathed in something
potentially poisonous but is symptom-free.\nThis does not mean an individual who is
symptom-free but requires information."
      },
      {
        "code": "2",
        "text": "labour or childbirth",
        "hint": "This means waters breaking, increasingly frequent contractions, seeing
or feeling the baby coming. This also means that a baby has just been born. DO NOT
SELECT THIS ANSWER if the individual has gone into labour following an injury to the
abdomen, lower back, groin or genitals. Select 'an injury or other health problem'
instead."
      },
      {
        "code": "3",
        "text": "a community service",
        "hint": "This means a palliative care team, community nurses, district nurses,
community midwives, falls team, rapid response team or another OOH service."
      },
      {
        "code": "4",
        "text": "a healthcare professional requesting contact with another clinician",
        "hint": "This means that a healthcare professional needs to speak with another
clinician."
      },
      {
        "code": "5",
        "text": "a report of results or tests",
        "hint": "This means a report of results of blood tests, X-rays, ECGs, or any
other test.\nThis does not mean a contact about an individual who has symptoms."
      },
      {
        "code": "6",
        "text": "a possible failure of contraception",
        "hint": "This means the individual is concerned about accidental pregnancy.
They may have failed to use contraception, run out of/missed pills, or a condom may
have split or come off, or had a problem with a contraceptive device.\nThis does not
mean an individual with symptoms such as vaginal bleeding or discharge. Select illness
or injury option."
      },
      {
```

```
        "code": "7",
        "text": "more",
        "hint": "This will take you to a further menu: \nChild protection or vulnerable
adult concern, social or domestic emergency, prescription or appointment request and a
request for health information."
      }
    ]
  }
}
```

Example 5: RS2

```
{
  "version": "48.2.0",
  "Pathways Assessment": "Reason for call menu - continued to next list.\nThere was no
blood loss.\nAn illness or health problem was the main problem.\nThe individual was not
fighting for breath.\nThe main reason for the assessment was not an allergic reaction,
heart attack, chest/upper back pain, probable stroke, recent fit/seizure or suicide
attempt.\nThe main reason for contact was not new confusion, declared diabetic hypo/
hyperglycaemia, or ICD shock.\nThe skin on the torso felt normal, warm or hot.\nThe
main problem was not a rash, itch, jaundice, skin lumps or abnormal bruising.\nThe main
problem was head lice.\nContact with somebody with head lice could not be confirmed."
  "Consultation Summary": "Illness\nHead lice"
  "question": {
    "code": "TX220668",
    "text": "Is there anything that might be a head louse or nit in the hair?",
    "hint": "To find out if head lice might be present.",
    "answers": [
      {
        "code": "1",
        "text": "yes",
        "hint": "This means head lice or nits can be seen in the hair.\nHead lice are
tiny grey-brown, wingless insects which may be seen moving in the hair.\nTheir eggs
(known as nits) are tiny white specks stuck to the base of hairs."
      },
      {
        "code": "2",
        "text": "not sure"
      },
      {
        "code": "3",
        "text": "no"
      }
    ]
  },
  "careAdvice": [
    "Head lice is common. Speak to a pharmacist for advice on suitable treatments."
  ]
}
```

Example 6: RS3

```
{
  "version": "48.2.0",
  "Pathways Assessment": "Reason for call menu - continued to next list.\nThere was no
blood loss.\nAn illness or health problem was the main problem.\nThe individual was not
fighting for breath.\nThe main reason for the assessment was not an allergic reaction,
heart attack, chest/upper back pain, probable stroke, recent fit/seizure or suicide
attempt.\nThe main reason for contact was not new confusion, declared diabetic hypo/
hyperglycaemia, or ICD shock.\nThe skin on the torso felt normal, warm or hot.\nThe
main problem was not a rash, itch, jaundice, skin lumps or abnormal bruising.\nThe main
problem was head lice.\nContact with somebody with head lice could not be confirmed.
\nNits or head lice were visible in the hair.\nThere was no recent patchy hair loss."
  "Consultation Summary": "Illness\nHead lice\nHead lice/nits visible in hair"
  "question": {
    "code": "TX220357",
    "text": "Does she seem generally unwell, apart from the sunburn?",
    "hint": "To find out if the child seems to be unwell, as well as sunburned.",
    "answers": [
      {
        "code": "1",
        "text": "yes"
      },
      {
        "code": "2",
        "text": "not sure"
      },
      {
        "code": "3",
        "text": "no"
      }
    ]
  },
  "careAdvice": [
    "Rest somewhere cool.",
    "Cool the skin by sponging with lukewarm water or having a tepid (not cold) bath or
shower. Don't use ice. Take care not to get too cold.",
    "Have plenty of non-alcoholic drinks to help cool down and to prevent dehydration."
  ],
  "outcome": {
    "symptomGroup": {
      "code": "SG1158",

    },
    "symptomDiscriminator": {
      "code": "SD4049",
      "name": "AMB heat stroke"
    },
    "disposition": {
      "code": "Dx012",
      "name": "Emergency Ambulance Response (Category 3)"
    }
  }
```

```
}
```

1.3.2.2 The body map

The body map is a special case that doesn't follow a typical question and answer format, but is a presentation of various groupings of options for selection. We present it as a `.question` with a special `.code` of "ClinicalArea" and a `.bodyMap` field instead of the usual `.text`, `.answers` and optional `.hint` fields.

Example 7: RS5

```
{
  "version": "48.2.0",
  "question": {
    "code": "ClinicalArea",
    "bodyMap": [
      {
        "areaGroup": "abdomen",
        "clinicalAreas": [
          {
            "clinicalAreaId": "15",
            "clinicalArea": "abdomen",
            "pathways": [
              {
                "linkId": "PW500",
                "pathwayTitle": "Abdominal or Flank Injury, Blunt",
                "doUseText": "An injury to the abdomen or flank within the last 7 days
that has not broken the skin \\n\\n(The abdomen is the area between the bottom of the
rib cage and the groin)\\n\\n(The flank is the fleshy part of the back at the side
between the bottom of the rib cage and the top of the hips)\\n\\nA deliberate self-
inflicted injury",
                "doNotUseText": "An abdominal or flank injury in the last 7 days that
has broken the skin (Abdominal or Flank Injury, Penetrating)"
              },
              {
                "linkId": "PW508",
                "pathwayTitle": "Abdominal or Flank Injury, Penetrating",
                "doUseText": "An injury to the abdomen or flank within the last 7 days
that has broken the skin \\n\\n(The abdomen is the area between the bottom of the rib
cage and the groin)\\n\\n(The flank is the fleshy part of the back at the side between
the bottom of the rib cage and the top of the hips)\\n\\nA deliberate self-inflicted
injury",
                "doNotUseText": "An abdominal or flank injury in the last 7 days that
has not broken the skin (Abdominal or Flank Injury, Blunt)\\n\\nA SMALL foreign body
such as a splinter of wood or glass in the skin (Skin, Minor Foreign Body)\\n\\nA
probable bite or sting (Bites and Stings)\\n\\nA scratch, graze or minor wound such as
a razor nick or paper cut (Scratches, Grazes and Minor Wounds)"
              },
              {
                "linkId": "PW1575",
                "pathwayTitle": "Bites and Stings",
```

```
                "doUseText": "A bite by a human, animal or insect\\n\\nA sting by an
animal, insect or water creature\\n\\nA deliberate self-injury",
                "doNotUseText": "Suspected scabies (Skin Problems)"
              },
              {
                "linkId": "PW564",
                "pathwayTitle": "Burn, Chemical",

1.3.2.3 Ending a triage

- We need to communicate that the triage is complete and the client does not need to continue to supply more information. This can be achieved by the absence of a `.question` field.
- We may need to communicate any number of care advice items. This can be achieved with the `.careAdvice` field, a map of Cx codes to presentation text.
- We may need to communicate an outcome, but it also could have already been given. This can be achieved with the `.outcome` field, containing separate fields for SG, SD, and Dx.

Example 8: Cx and Dx

```
{
  "version": "48.2.0",
  "Pathways Assessment": "Reason for call menu - continued to next list.\nThere was no blood loss.\nAn illness or health problem was the main problem.\nThe individual was not fighting for breath.\nThe main reason for the assessment was not an allergic reaction, heart attack, chest/upper back pain, probable stroke, recent fit/seizure or suicide attempt.\nThe main reason for contact was not new confusion, declared diabetic hypo/hyperglycaemia, or ICD shock.\nThe skin on the torso felt normal, warm or hot.\nThe main problem was not a rash, itch, jaundice, skin lumps or abnormal bruising.\nThe main problem was head lice.\nContact with somebody with head lice could not be confirmed.\nNits or head lice were visible in the hair.\nThere was no recent patchy hair loss.\nThere was general scaling of the scalp."
  "Consultation Summary": "Illness\nHead lice\nHead lice/nits visible in hair\nFlaky/scaly scalp"
  "outcome": {
    "symptomGroup": {
      "code": "SG1109",
      "name": "Head Lice"
    },
    "symptomDiscriminator": {
      "code": "SD4003",
      "name": "PC full Primary Care assessment and prescribing capability"
    },
    "disposition": {
      "code": "Dx09",
      "name": "For persistent or recurrent symptoms: get in touch with the GP Practice for a Non-Urgent Appointment"
    }
  },
  "careAdvice": {
    "Cx221052": "Head lice is common. Speak to a pharmacist for advice on suitable treatments."
  }
}
```

Example 9: RS4

```
{
  "Pathways Assessment": "Reason for call menu - continued to next list.\nThere was no blood loss.\nAn illness or health problem was the main problem.\nThe individual was not fighting for breath.\nThe main reason for the assessment was not an allergic reaction, heart attack, chest/upper back pain, probable stroke, recent fit/seizure or suicide attempt.\nThe main reason for contact was not new confusion, declared diabetic hypo/hyperglycaemia, or ICD shock.\nThe skin on the torso felt normal, warm or hot.\nThe main problem was not a rash, itch, jaundice, skin lumps or abnormal bruising.\nThe main problem was head lice.\nContact with somebody with head lice could not be confirmed.\nNits or head lice were visible in the hair.\nThere was no recent patchy hair loss.\nThere was general scaling of the scalp."
  "Consultation Summary": "Illness\nHead lice\nHead lice/nits visible in hair\nFlaky/scaly scalp"
  "version": "48.2.0"
}
```

1.3.2.4 Schema

Field	Card.	Type	Description	Provenance
`version`	1	String	The exact version of Pathways used by the engine.	Database `tblReleases.Version`
`outcome`	0..1	Object	The triage decision from Pathways.	Pathways.
`.symptomGroup`	1	Object	The symptom group of the triage outcome.	Pathways.
`.code`	1	String	The code of the symptom group.	Database `tblSymptomGroups.SgIdWithPrefix`

Field	Card.	Type	Description	Provenance
`.name`	1	String	The name of the symptom group.	Database `tblSymptomGroups.SgDesc`
`.symptomDiscriminator`	1	Object	The symptom discriminator of the triage outcome.	Pathways.
`.code`	1	String	The code of the symptom discriminator.	Database `tblSymptomDiscriminators.SdIdWithPrefix`
`.name`	1	String	The name of the symptom discriminator.	Database `tblSymptomDiscriminators.SdDesc`
`.disposition`	1	Object	The disposition of the triage outcome.	Pathways.
`.code`	1	String	The code of the disposition.	Database `tblDxDispositions.DispositionCode`
`.name`	1	String	The name of the disposition.	Database `tblDxDispositions.DispositionText`
`careAdvice`	0..1	Map	Care advice to be given to the contact.	Pathways.
`.[key:]`	*	String	The identifier of the care advice.	Database `tblCxCareAdviceItems.CareAdviceID`

Field	Card.	Type	Description	Provenance
`.[:value]`	*	String	The text of the care advice.	Database `tblCxCareAdviceItems.CareAdviceText`
`question`	0..1	Object	The next question to put to the contact. See Question Schema.	Pathways.

1.3.2.4.1 Question Schema

The `question` field may be either a "normal question" or a "clinical area selection".

1.3.2.4.1.1 Normal question schema

Field	Card.	Type	Description	Provenance
`code`	1	String	The ID of the question.	Database `tblTxQuestions.QuestionID`
`text`	1	String	The text of the question.	Database `tblTxQuestions.QuestionText`
`hint`	0..1	String	Any hint text for the question.	Database `tblTxQuestions.QuestionRationale`
`answers`	1	Array	The possible answers to select from.	Pathways.

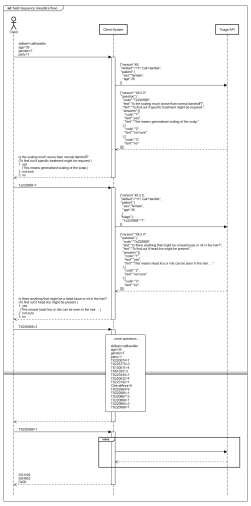

Field	Card.	Type	Description	Provenance
`.*`	1..*	Object	An answer.	Pathways.
`.code`	1	String	The ID of the answer.	Database `tblTriageLogic.AnswerNumber`
`.text`	1	String	The wording of the answer.	Database `tblTxAnswers.AnswerText`
`.hint`	0..1	String	Hints to support selection of the answer.	Database `tblTxAnswers.AnswerRationale`

1.3.2.4.1.2 Clinical area selection schema

Field	Card.	Type	Description	Provenance
code	1	String	The ID of the question. In this case always "ClinicalArea".	
bodyMap	1	Map	The body map to choose a clinical area of concern.	Pathways.
`.[key:]`	*	String	Name of an area grouping.	Database `tblClinicalAreas.AreaGroup`

Field	Card.	Type	Description	Provenance
`.[:value]`	*	Map	The clinical areas within that grouping.	Pathways.
`.[key:]`	*	String	The name of a clinical area.	Database `tblClinicalAreas.ClinicalAreaDescription`
`.[:value]`	*	String	The code for the clinical area.	Database `tblClinicalAreas.ClinicalAreaID`

1.3.3 Sequence diagram

            additionalProperties:
              type: string
```

1.4 FHIR Bundle request response approach

Note: The FHIR Task Stateless and Stateful will be taken forward for the designs for the Patient Triage API. Therefore, this page will not receive further updates to keep it aligned with the FHIR Task designs

Please review the FHIR Task stateless approach (see page 146) **and** FHIR Task stateful request response approach (see page 238) **going forward**

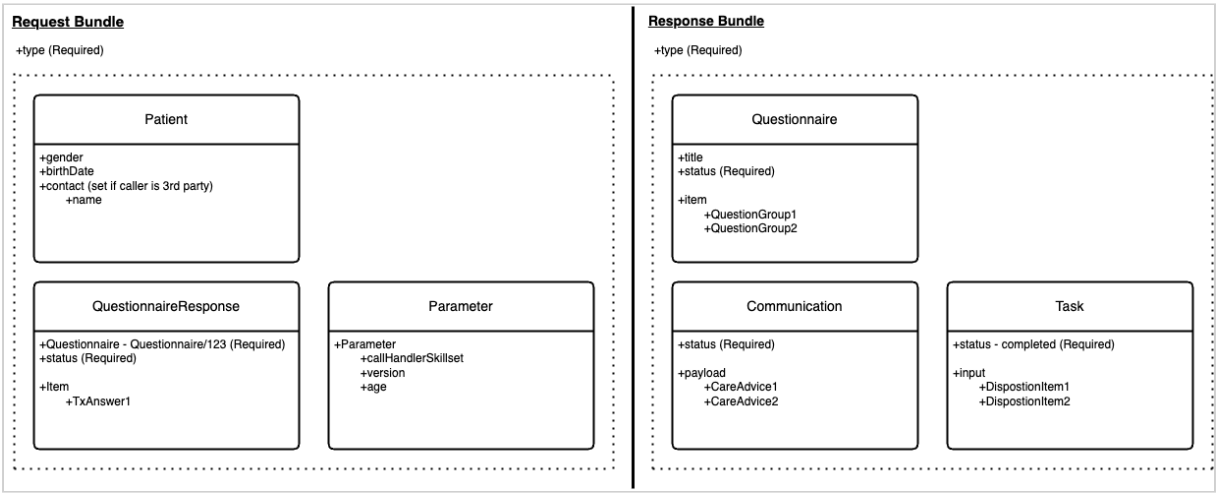

1.4.1 Overview

1.4.1.1 Key points

- All "id" fields in the resources used will be set to generic uuids e.g. 123e4567-e89b-12d3-a456-426614174002, as per the FHIR-IDENT-01[1] of the NHS FHIR Policy. The identifiers filed can be used for adding table ids to resources to better identify what path, question, disposition, care advice etc they are linked to.
- As we are sending these FHIR resources after mapping them from both the client and server, these resources will not be already sorted somewhere to use an literal reference. Where a resource needs to reference another in a field, such as the QuestionnaireResponse must reference a Questionnaire, a logical reference will be used. This is done to align with FHIR-IDENT-03[2] of the NHS FHIR Policy

1.4.1.2 FHIR Model

[NPT-277] TaaS FHIR API PoC: Document the FHIR model for the API - CDT Jira[3]

1.4.2.2 Schema tables

1.4.2.2.1 Bundle Resource

Field	Card.	Type	Description	Provenance
resourceType	1	string	Must be "bundle".	
type	1	string	Must be "collection".	

Field	Card.	Type	Description	Provenance
`entry`	1..*	object[]	The contents of the bundle. Each entry contains the resource and fullUri field. The fullUri field should set using the id of the resource in the following format • fullUrl: urn:uuid:123e4567-e89b-12d3-a456-426614174000 Exactly one member must represent a Patient. At most one member can represent a RelatedPerson. Any number of other elements may be QuestionnaireResponses.	

1.4.2.2.2 Parameter schema

Field	Card.	Type	Description	Provenance
resourceType	1	string	Must be "Parameter".	
id	0..1	string	Unique identifier for the resource	
parameter	0..*	BackboneElement	Elements used to define pathways versions, variables, call handler skillset or age	From the call handler/ service
parameter.name	1..1	string	Type of input, e.g., `skillset`, `ageYears`, `ageGroup`, `gender`, `case`, `version`, `CxSymptomManagementBluntInjuries`	
parameter.valueString	0..1	string	Value of the input when it's a string, e.g., `111 Call Handler`, `F`, `3`, `TX123456, Present, Adult, 1990-01-01`	

Field	Card.	Type	Description	Provenance
parameter.valueAge	0..1	object	Age value of the parameter, including value, unit, system, and code	
input.valueAge.value	1..1	`Number`	Only for patient age. Value of the input when it's an age, e.g., `35, 1`	
input.valueAge.unit	1..1	`String`	Only for patient age. Unit of the age, e.g., `years`	
input.valueAge.system	1..1	`String`	Only for patient age. System of measurement, e.g., `http://unitsofmeasure.org`[4]	
input.valueAge.code	1..1	`String`	Only for patient age. Code for the unit, e.g., a (Not useful field, but must be set as per FHIR spec - code must be set if system and/or value are)	

1.4.2.2.3 Patient schema

Field	Card.	Type	Description	Provenance
`resourceType`	1	string	Must be "Patient".	
id	0..1	string	Unique identifier for the resource	
text.status	1..1	`String`	Must be "generated"	
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Patient (see page 55) demographics "	

4. http://unitsofmeasure.org/

Field	Card.	Type	Description	Provenance
gender	0..1	string	One of "male", "female", "unknown" and "other".	The patient or person contacting the healthcare service on the patient's behalf.
birthDate	0..1	date	To be set in the format YYYY-MM-DD. As we are only capturing the age of the patient for triage, we will set the month and date to the 1st January e.g. YYYY-01-01. This will ensure the age we set based on the year is correct. Note: the age could be set as a parameter, rather than using the dateBirth field of the patient resource	The patient or person contacting the healthcare service on the patient's behalf.

1.4.2.2.4 QuestionnaireResponse schema

Field	Cardinality	Type	Description	Provenance
resourceType	1..1	string	Must be "QuestionnaireResponse".	
id	0..1	string	Unique identifier for the resource	
status	1..1	string	Must be "in-progress"	
questionnaire	0..1	string	Reference to the questionnaire that this QuestionnaireResponse is answering. This will be done as a logical reference as per the NHS API FHIR policy: https://developer.nhs.uk/apis/fhir-policy/identifiers.html#FHIR-IDENT-03	
identifier	0..1	codeableConcept	An array of identifiers	
item	0..*	array	An array of items	
item[x].linkId	1..1	string	QuID of the TxQuestions this QuestionnaireResponse is answering, e.g. "Tx1066"	

Field	Cardinality	Type	Description	Provenance
item[x].answer	0..*	array	An array of answers	
item[x].answer[i].valueCoding.code	0..1	string	Stores the answer of to the TxQuestion.	

1.4.3 Response

1.4.3.2 Schema tables

1.4.3.2.1 Task resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the task
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Returning (see page 55) no details "
`resourceType`	1..1	`String`	Type of resource, must be set to `Task`
`identifier`	0..*	`Array`	Identifiers for the task
`identifier.value`	1..1	`String`	Value of the identifier, e.g., `Triage17678`
`status`	1..1	`String`	Status of the task, e.g., `in-progress`
`intent`	1..1	`String`	Intent of the task, e.g., `plan`
`input`	0..*	`Array`	List of returned variables and their value
`input.type.text`	1..1	`String`	• The name of the variable being returned, such as "injury,illnessorlabourestablishedinEntryFlow"

Field	Cardinality	Type	Description
`input.valueString`	0..1	`String`	• Value of the returned variable, such as "present"
`output`	0..*	`Array`	Contains the "Pathways Assessment" and "Consultation Summary" if info has been stored so far
`output.type.text`	1..1	`String`	• Must be "Pathways Assessment" or "Consultation Summary"
`output.valueString`	0..1	`String`	• The combined string for the summery or assessment. String will be made of with all the lines for the summery/assessment, separated by newline characters

1.4.3.2.2 Questionnaire Resource

1.4.3.2.2.1 For single/multiple answer questions

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the questionnaire
`resourceType`	1..1	`String`	Type of resource, must be set `Questionnaire`
`identifier`	0..*	`Array`	Identifiers for the questionnaire
`identifier.value`	1..1	`String`	Value of the identifier, e.g., `TX220357`
`status`	1..1	`String`	Status of the questionnaire, e.g., `active`

Field	Cardinality	Type	Description
`subjectType`	0..*	`Array`	Types of subjects, e.g., `Patient`
`item`	0..*	`Array`	Top level question item
`item.linkId`	1..1	`String`	Id of the question, e.g., `TX220357`
`item.type`	1..1	`String`	Must be set to `group`
`item.text`	0..*	`Array`	Question text e.g., What is the reason for the contact?
`item.item`	1..1	`String`	Rationale and answer groups

Questionnaire item for answer group

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	must be set as {QuestionId}.x.group where x is the answer number, e.g TX220074.1.Group
`item.type`	1..1	`String`	Must be set to `coding`
`item.answerOption`	0..*	`Array`	List of answer options for coding items, should be only one option

Field	Cardinality	Type	Description
`item.answerOption.valueCoding.code`	1..1	`String`	Code of the answer option, e.g., `1`, `2`, `3`
`item.answerOption.valueCoding.display`	1..1	`String`	Display text of the answer option, e.g., `yes`, `not sure`, `no`
`item.item`	0..*	`Array`	Item for answer hint text

Questionnaire item for question rationale and answer hint text

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Must be set to: • {QuestionId}.Rationale for question rational text • {QuestionId}.x.hint for hint items, where x is the answer number, e.g TX220074.1.hint
`item.text`	0..1	`String`	Text of the item, e.g., `Does she seem generally unwell, apart from the sunburn?`
`item.type`	1..1	`String`	Type of the item, must be set to `display`

1.4.3.2.2.2 Questionnaire for body map questions

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the questionnaire

Field	Cardinality	Type	Description
`resourceType`	1..1	`String`	Type of resource, must be set `Questionnaire`
`identifier`	0..*	`Array`	Identifiers for the questionnaire
`identifier[0].value`	1..1	`String`	Question ID or Bodymap
`identifier[1].value`	1..1	`String`	Pathway ID, is not set for bodymap
`identifier[2].value`	1..1	`String`	Order number, is not set for bodymap
`status`	1..1	`String`	Status of the questionnaire, must be set to `active`
`subjectType`	0..*	`Array`	Types of subjects, set to `Patient`
`item`	0..*	`Array`	List of grouped body parts/areas
`item.linkId`	1..1	`String`	Name of the body area group
`item.type`	1..1	`String`	Must be set to "`group`"
`item.item`	0..1	`String`	Text of the item, e.g., `15`, `14`, `13`, `4`, etc.

Questionnaire items for body area choices

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Name of body part
`item.type`	1..1	`String`	`Must be set to "display"`
`item.text`	0..1	`String`	Text of the item, e.g., `15`, `14`, `13`, `4`, etc.

Field	Cardinality	Type	Description
`item.item`	0..*	`Array`	Pathways for selection

Questionnaire items for pathways from bodymap

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Pathway id e.g. "PW500"
`item.type`	1..1	`String`	`Must be set to "group"`
`item.text`	0..1	`String`	Pathway title
`item.item[0].linkId`	1..1	`String`	Must be "doUseText"
`item.item[0].type`	1..1	`String`	Must be "display"
`item.item[0].text`	0..1	`String`	Must be the value of the "KP_Use" filed from Pathways table
`item.item[1].linkId`	1..1	`String`	Must be "doNotUseText"
`item.item[1].type`	1..1	`String`	Must be "display"
`item.item[1].text`	0..1	`String`	Must be the value of the "KP_NotUse" filed from Pathways table

1.4.3.2.3 ServiceRequest Resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the service request

Field	Cardinality	Type	Description
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Disposition (see page 55), symptomGroup and symptomDiscriminator from triage engine "
`resourceType`	1..1	`String`	Type of resource, must be set to `ServiceRequest`
`status`	1..1	`String`	Status of the service request, must be set to `active`
`intent`	1..1	`String`	Intent of the service request, must be set to `proposal`
`code.concept.text`	1..1	`String`	Text of the code concept, e.g., Outcome (must be set if using OrderDetail as per FHIR spec for ServiceRequest
`subject.identifier.system`	1..1	`String`	System of the subject identifier, e.g., `http://fhir.nhs.uk/Id/patient`
`subject.identifier.value`	1..1	`String`	Value of the subject identifier, e.g., `b8c6686b-846e-4582-8a2c-e60e8397ba51`
`orderDetail`	0..*	`Array`	List of order details
`orderDetail[x].coding[0].code`	1..1	`String`	ID of the the outcome e.g., `SG1158` , `SD4049` , `Dx012`

Field	Cardinality	Type	Description
`orderDetail[x].coding[0].display`	1..1	`String`	Display text of the outcome type, e.g., `symptomGroup`, `symptomDiscriminator`, `disposition`
`orderDetail[x].text`	1..1	`String`	Text value of the outcome, e.g., `Sunburn`, `AMB heat stroke`, `Emergency Ambulance Response (Category 3)`

1.4.3.2.4 Communication Resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the communication
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Care (see page 55) advice from triage engine "
`resourceType`	1..1	`String`	Type of resource, must be set to `Communication`
`status`	1..1	`String`	Status of the communication, must be set to `completed`
`payload`	0..*	`Array`	List of care advice items

Field	Cardinality	Type	Description
`payload.contentString`	1..1	`String`	Care advice text, e.g., `Rest somewhere cool.`, `Cool the skin by sponging with lukewarm water or having a tepid (not cold) bath or shower. Don't use ice. Take care not to get too cold.`, `Have plenty of non-alcoholic drinks to help cool down and to prevent dehydration.`

1.5 FHIR Task stateless approach

1.5.1 Overview

1.5.1.1 Stateless approach

This approach is similar to the stateful FHIR task, but instead of using references to store resources on the API's side, all the triage demographics and previous questions are stored in the task resource directly.

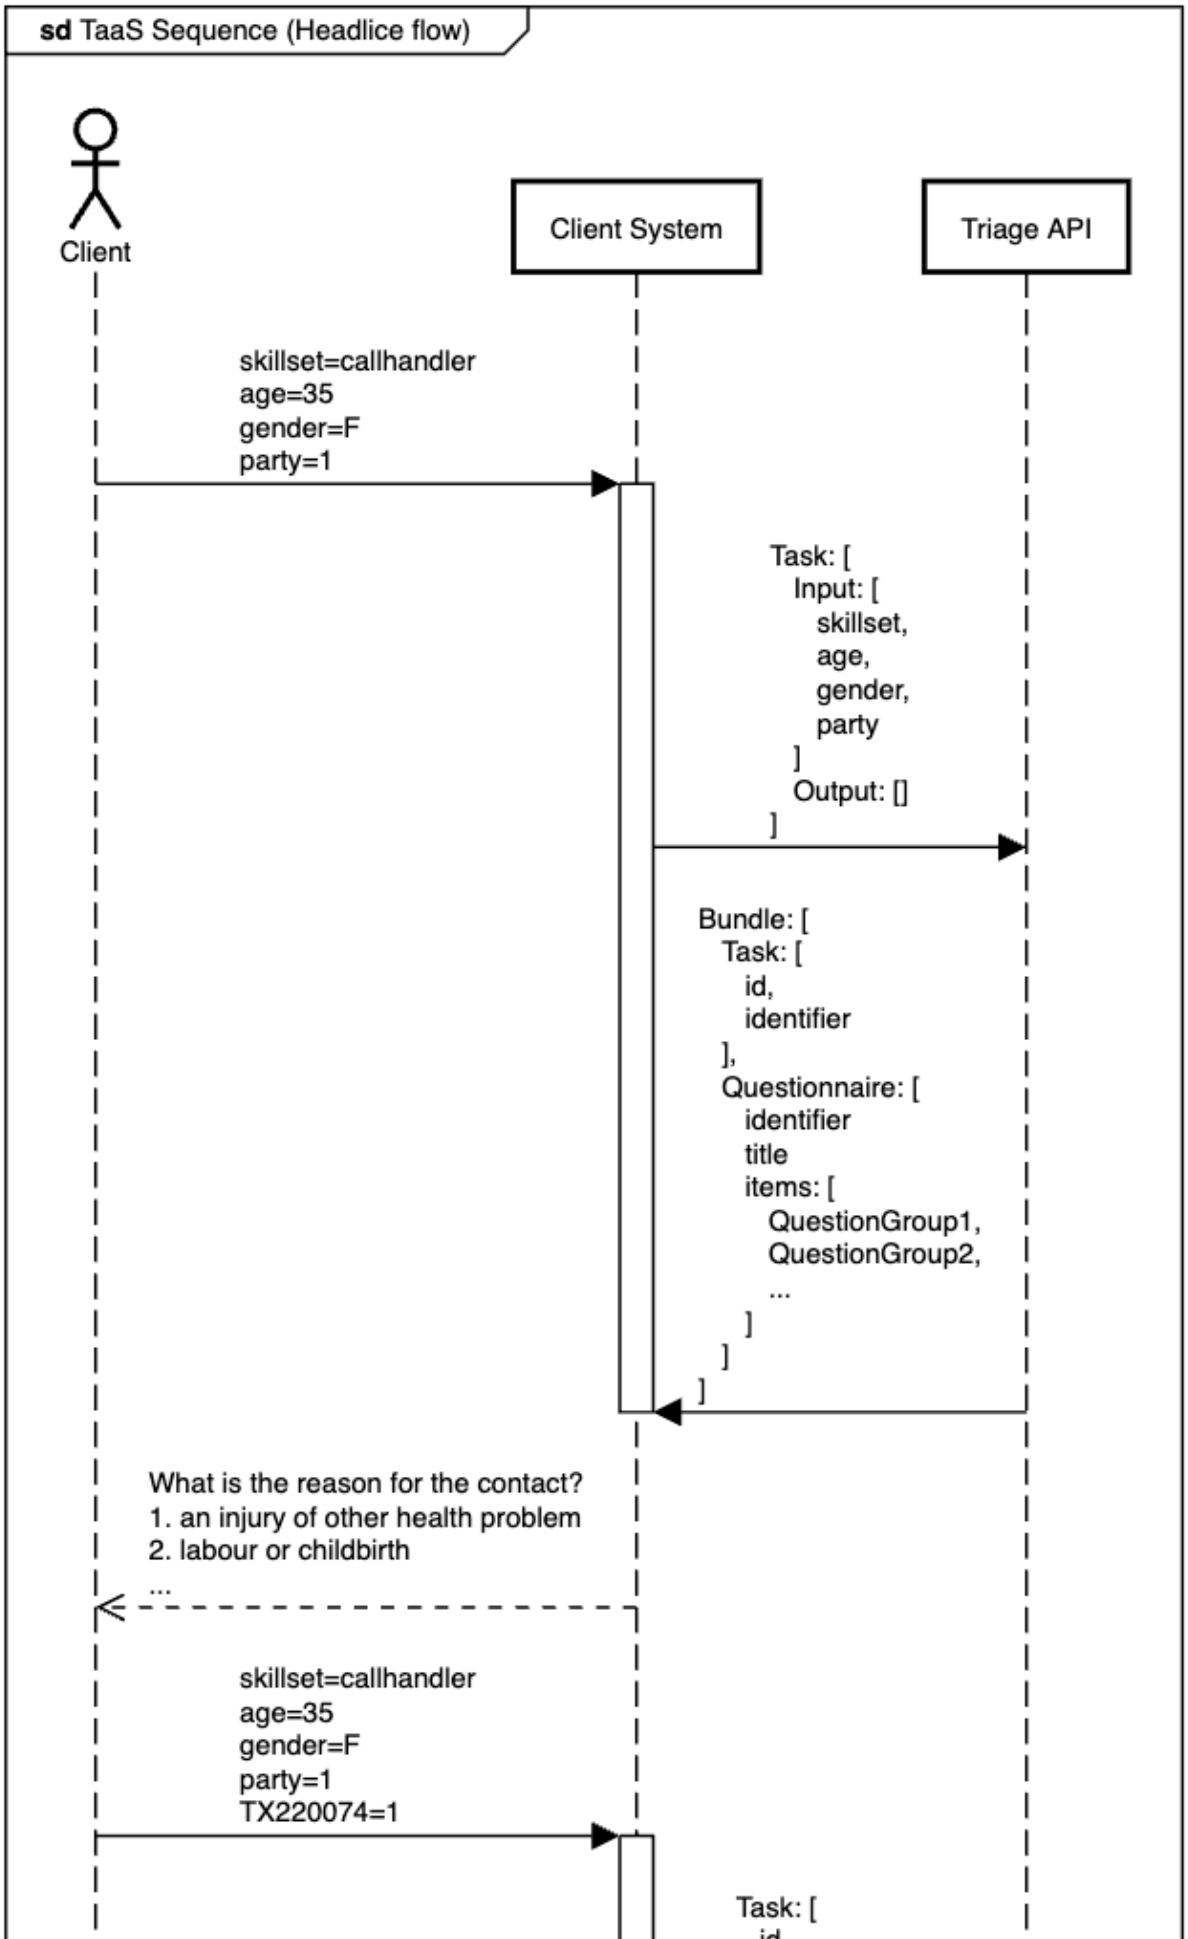

The output filed is used to store the the triage demographics and previous questions and the input field is used to send the details to start the triage then store the answers to questions sent by the API.

The client requests will always only require the task resource alone. The API will always respond with the task resource that was sent on the request, but may also return a Questionnaire fro the next question, a Communication resource for care advice items and/or a ServiceRequest resource to return outcomes/dispositions. These will be grouped in bundle if more than one resource needs to be sent in the response (the bundle will have a maximum. of one Task, one Questionnaire, one Communication and one ServiceRequest).

1.5.1.2 Triage interaction with API

The sequence diagram below shows the interaction/exchange between a user and the API.

Diagram

sd TaaS Sequence (Headlice flow)
Client
Client System
Triage API
skillset=callhandler

1.5.2.2 Schema tables

1.5.2.2.1 Task Resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the task
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Returning (see page 146) no details "
`resourceType`	1..1	`String`	Type of resource, must be set `Task`
`status`	1..1	`String`	Status of the task, e.g., `requested, in-progress, failed, completed`
`intent`	1..1	`String`	Intent of the task, e.g., must be `plan`
`input`	0..*	`Array`	List of triage demographics or variables for starting triage or question answer
`input.type.text`	1..1	`String`	Type of input, e.g., `skillset`, birthDate, ageGroup, ageYears, `gender`, `case, version, CxSymptomManagementBluntInjuries`
`input.valueString`	0..1	`String`	Value of the input when it's a string, e.g., `111 Call Handler`, `F`, `3, TX123456, Present,` 1990-01-01, adult
`input.valueAge.value`	1..1	`Number`	Only for patient age. Value of the input when it's an age, e.g., `35, 1`

Field	Cardinality	Type	Description
`input.valueAge.unit`	1..1	`String`	Only for patient age. Unit of the age, e.g., `years`
`input.valueAge.system`	1..1	`String`	Only for patient age. System of measurement, e.g., `http://unitsofmeasure.org`
`input.valueAge.code`	1..1	`String`	Only for patient age. Code for the unit, e.g., a (Not useful field, but must be set as per FHIR spec - code must be set if system and/or value are)

1.5.3.2 Schema tables

1.5.3.2.1 Task resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the task
text.status	1..1	`String`	Must be "generated"

Field	Cardinality	Type	Description
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Returning (see page 146) no details "
`resourceType`	1..1	`String`	Type of resource, must be set to `Task`
`identifier`	0..*	`Array`	Identifiers for the task
`identifier.value`	1..1	`String`	Value of the identifier, e.g., `Triage17678`
`status`	1..1	`String`	Status of the task, e.g., `in-progress`
`intent`	1..1	`String`	Intent of the task, e.g., `plan`
`input`	0..*	`Array`	List of returned variables and their value
`input.type.text`	1..1	`String`	• The name of the variable being returned, such as "injury,illnessorlabourestablishedinEntryFlow"
`input.valueString`	0..1	`String`	• Value of the returned variable, such as "present"
`output`	0..*	`Array`	Contains the "Pathways Assessment" and "Consultation Summary" if info has been stored so far
`output.type.text`	1..1	`String`	• Must be "Pathways Assessment" or "Consultation Summary"

Field	Cardinality	Type	Description
`output.valueString`	0..1	`String`	• The combined string for the summery or assessment. String will be made of with all the lines for the summery/assessment, separated by newline characters

1.5.3.2.2 Questionnaire Resource

1.5.3.2.2.1 For single/multiple answer questions

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the questionnaire
`resourceType`	1..1	`String`	Type of resource, must be set `Questionnaire`
`identifier`	0..*	`Array`	Identifiers for the questionnaire
`identifier.value`	1..1	`String`	Value of the identifier, e.g., `TX220357`
`status`	1..1	`String`	Status of the questionnaire, e.g., `active`
`subjectType`	0..*	`Array`	Types of subjects, e.g., `Patient`
`item`	0..*	`Array`	Top level question item
`item.linkId`	1..1	`String`	Id of the question, e.g., `TX220357`

Field	Cardinality	Type	Description
`item.type`	1..1	`String`	Must be set to `group`
`item.text`	0..*	`Array`	Question text e.g., What is the reason for the contact?
`item.item`	1..1	`String`	Rationale and answer groups

Questionnaire item for answer group

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	must be set as {QuestionId}.x.group where x is the answer number, e.g TX220074.1.Group
`item.type`	1..1	`String`	Must be set to `coding`
`item.answerOption`	0..*	`Array`	List of answer options for coding items, should be only one option
`item.answerOption.valueCoding.code`	1..1	`String`	Code of the answer option, e.g., `1`, `2`, `3`
`item.answerOption.valueCoding.display`	1..1	`String`	Display text of the answer option, e.g., `yes`, `not sure`, `no`

Field	Cardinality	Type	Description
`item.item`	0..*	`Array`	Item for answer hint text

Questionnaire item for question rationale and answer hint text

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Must be set to: • {QuestionId}.Rationale for question rational text • {QuestionId}.x.hint for hint items, where x is the answer number, e.g TX220074.1.hint
`item.text`	0..1	`String`	Text of the item, e.g., `Does she seem generally unwell, apart from the sunburn?`
`item.type`	1..1	`String`	Type of the item, must be set to `display`

1.5.3.2.2.2 Questionnaire for body map questions

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the questionnaire
`resourceType`	1..1	`String`	Type of resource, must be set `Questionnaire`
`identifier`	0..*	`Array`	Identifiers for the questionnaire
`identifier[0].value`	1..1	`String`	Question ID or Bodymap
`identifier[1].value`	1..1	`String`	Pathway ID, is not set for bodymap

Field	Cardinality	Type	Description
`identifier[2].value`	1..1	`String`	Order number, is not set for bodymap
`status`	1..1	`String`	Status of the questionnaire, must be set to `active`
`subjectType`	0..*	`Array`	Types of subjects, set to `Patient`
`item`	0..*	`Array`	List of grouped body parts/areas
`item.linkId`	1..1	`String`	Name of the body area group
`item.type`	1..1	`String`	Must be set to "`group"`
`item.item`	0..1	`String`	Text of the item, e.g., `15`, `14`, `13`, `4`, etc.

Questionnaire items for body area choices

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Name of body part
`item.type`	1..1	`String`	`Must be set to "display"`
`item.text`	0..1	`String`	Text of the item, e.g., `15`, `14`, `13`, `4`, etc.
`item.item`	0..*	`Array`	Pathways for selection

Questionnaire items for pathways from bodymap

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Pathway id e.g. "PW500"

Field	Cardinality	Type	Description
`item.type`	1..1	`String`	`Must be set to "group"`
`item.text`	0..1	`String`	Pathway title
`item.item[0].linkId`	1..1	`String`	Must be "doUseText"
`item.item[0].type`	1..1	`String`	Must be "display"
`item.item[0].text`	0..1	`String`	Must be the value of the "KP_Use" filed from Pathways table
`item.item[1].linkId`	1..1	`String`	Must be "doNotUseText"
`item.item[1].type`	1..1	`String`	Must be "display"
`item.item[1].text`	0..1	`String`	Must be the value of the "KP_NotUse" filed from Pathways table

1.5.3.2.3 ServiceRequest Resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the service request
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Disposition (see page 146), symptomGroup and symptomDiscriminator from triage engine "

Field	Cardinality	Type	Description
`resourceType`	1..1	`String`	Type of resource, must be set to `ServiceRequest`
`status`	1..1	`String`	Status of the service request, must be set to `active`
`intent`	1..1	`String`	Intent of the service request, must be set to `proposal`
`code.concept.text`	1..1	`String`	Text of the code concept, e.g., Outcome (must be set if using OrderDetail as per FHIR spec for ServiceRequest
`subject.identifier.system`	1..1	`String`	System of the subject identifier, e.g., `http://fhir.nhs.uk/Id/patient`
`subject.identifier.value`	1..1	`String`	Value of the subject identifier, e.g., `b8c6686b-846e-4582-8a2c-e60e8397ba51`
`orderDetail`	0..*	`Array`	List of order details
`orderDetail[x].coding[0].code`	1..1	`String`	ID of the the outcome e.g., `SG1158`, `SD4049`, `Dx012`
`orderDetail[x].coding[0].display`	1..1	`String`	Display text of the outcome type, e.g., `symptomGroup`, `symptomDiscriminator`, `disposition`

Field	Cardinality	Type	Description
`orderDetail[x].text`	1..1	`String`	Text value of the outcome, e.g., `Sunburn`, `AMB heat stroke`, `Emergency Ambulance Response (Category 3)`

1.5.3.2.4 Communication Resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the communication
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Care (see page 146) advice from triage engine "
`resourceType`	1..1	`String`	Type of resource, must be set to `Communication`
`status`	1..1	`String`	Status of the communication, must be set to `completed`
`payload`	0..*	`Array`	List of care advice items
`payload.contentString`	1..1	`String`	Care advice text, e.g., `Rest somewhere cool.`, `Cool the skin by sponging with lukewarm water or having a tepid (not cold) bath or shower. Don't use ice.` `Take care not to get too cold.`, `Have plenty of non-alcoholic drinks to help cool down and to prevent dehydration.`

1.6 FHIR Task stateful request response approach

1.6.1 Overview

1.6.1.1 Stateful approach

This approach will be stateful; the state of the interaction will be tracked by a Task resource[5], that will be in every exchange. This will be set in the "status" field.

When a user sends the first request, the status will be set to "requested". The API will send one of two responses:

- A Task resource with status set to "accepted". It will be send as part of a bundle, containing a Questionnaire resource with the first question of the triage
- A Task resource with status set to "failed". This will be the only resource set back to the user in response

Once the triage has started, the Task will be set to "in-progress" while the triage interaction continues, except for if there is an error.

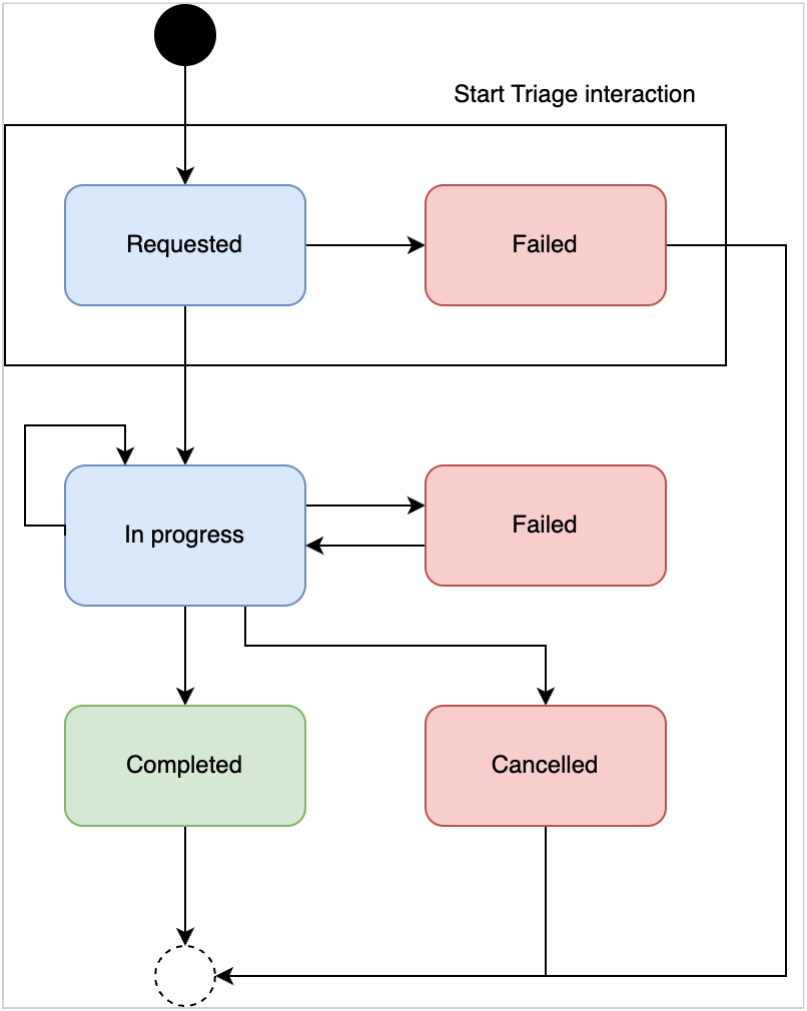

In this case, the API will return a Task resource with status of "failed". This can be used for if the user sends a request with errors or an error has occurred on the API's part

Once the triage has ended, the Task will be set to "completed" in the last response from the API.

The triage can be stopped half way through by sending the API the Task used to track the triage interaction with the status field set to "cancelled"

A diagram showing the statuses in the follow can be found below. This is based on the Task state machine diagram from https://hl7.org/fhir/task.html#statemachine.

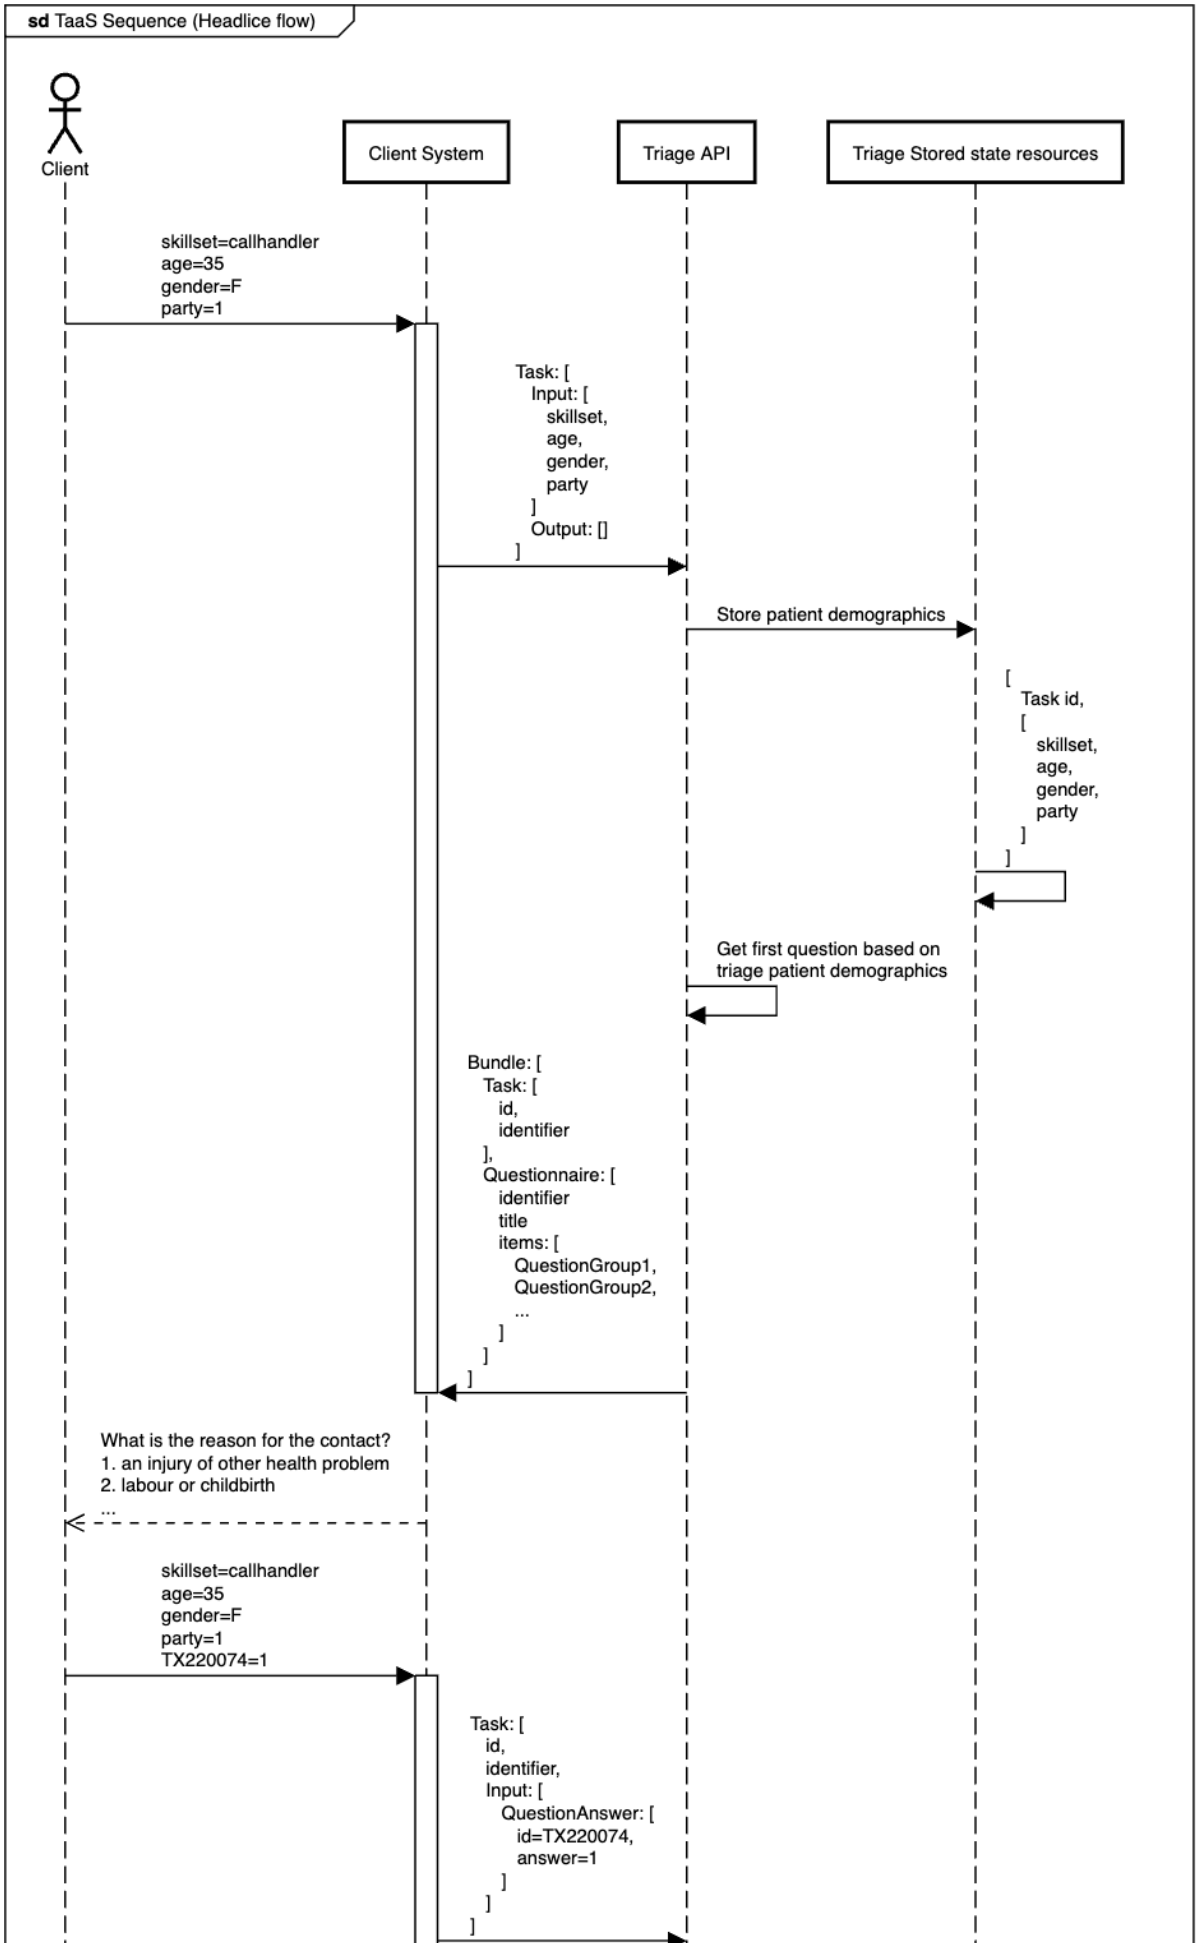

5. https://hl7.org/fhir/task.html

1.6.1.2 Triage interaction with API

The sequence diagram below shows the interaction/exchange between a user and the API.

```

1.6.2.2 Schema tables

1.6.2.2.1 Task Resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the task
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Returning (see page 238) no details "
`resourceType`	1..1	`String`	Type of resource, must be set `Task`
`status`	1..1	`String`	Status of the task, e.g., `requested, in-progress, failed, completed`
`intent`	1..1	`String`	Intent of the task, e.g., must be `plan`
`input`	0..*	`Array`	List of triage demographics
`input.type.text`	1..1	`String`	Type of input, e.g., `skillset`, `ageGroup, ageYears, birthDate`, `gender`, `case, version`
`input.valueString`	0..1	`String`	Value of the input when it's a string, e.g., `111 Call Handler`, `F`, `3, adult, 1990-01-01`
`input.valueAge.value`	1..1	`Number`	Only for patient age. Value of the input when it's an age, e.g., `35`

Field	Cardinality	Type	Description
`input.valueAge.unit`	1..1	`String`	Only for patient age. Unit of the age, e.g., `years`
`input.valueAge.system`	1..1	`String`	Only for patient age. System of measurement, e.g., `http://unitsofmeasure.org`
`input.valueAge.code`	1..1	`String`	Only for patient age. Code for the unit, e.g., a (Not useful field, but must be set as per FHIR spec - code must be set if system and/or value are)

1.6.3.2 Schema tables

1.6.3.2.1 Task resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the task

Field	Cardinality	Type	Description
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Returning (see page 238) no details "
`resourceType`	1..1	`String`	Type of resource, must be set to `Task`
`identifier`	0..*	`Array`	Identifiers for the task
`identifier.value`	1..1	`String`	Value of the identifier, e.g., `Triage17678`
`status`	1..1	`String`	Status of the task, e.g., `in-progress`
`intent`	1..1	`String`	Intent of the task, e.g., `plan`
`input`	0..*	`Array`	List of returned variables and their value
`input.type.text`	1..1	`String`	• The name of the variable being returned, such as "injury,illnessorlabourestablishedinEntryFlow"
`input.valueString`	0..1	`String`	• Value of the returned variable, such as "present"
`output`	0..*	`Array`	Contains the "Pathways Assessment" and "Consultation Summary" if info has been stored so far

Field	Cardinality	Type	Description
`output.type.text`	1..1	`String`	• Must be "Pathways Assessment" or "Consultation Summary"
`output.valueString`	0..1	`String`	• The combined string for the summery or assessment. String will be made of with all the lines for the summery/assessment, separated by newline characters

1.6.3.2.2 Questionnaire Resource

1.6.3.2.2.1 For single/multiple answer questions

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the questionnaire
`resourceType`	1..1	`String`	Type of resource, must be set `Questionnaire`
`identifier`	0..*	`Array`	Identifiers for the questionnaire
`identifier.value`	1..1	`String`	Value of the identifier, e.g., `TX220357`
`status`	1..1	`String`	Status of the questionnaire, e.g., `active`
`subjectType`	0..*	`Array`	Types of subjects, e.g., `Patient`
`item`	0..*	`Array`	Top level question item

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Id of the question, e.g., `TX220357`
`item.type`	1..1	`String`	Must be set to `group`
`item.text`	0..*	`Array`	Question text e.g., What is the reason for the contact?
`item.item`	1..1	`String`	Rationale and answer groups

Questionnaire item for answer group

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	must be set as {QuestionId}.x.group where x is the answer number, e.g TX220074.1.Group
`item.type`	1..1	`String`	Must be set to `coding`
`item.answerOption`	0..*	`Array`	List of answer options for coding items, should be only one option
`item.answerOption.valueCoding.code`	1..1	`String`	Code of the answer option, e.g., `1`, `2`, `3`
`item.answerOption.valueCoding.display`	1..1	`String`	Display text of the answer option, e.g., `yes`, `not sure`, `no`

Field	Cardinality	Type	Description
`item.item`	0..*	`Array`	Item for answer hint text

Questionnaire item for question rationale and answer hint text

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Must be set to: • {QuestionId}.Rationale for question rational text • {QuestionId}.x.hint for hint items, where x is the answer number, e.g TX220074.1.hint
`item.text`	0..1	`String`	Text of the item, e.g., `Does she seem generally unwell, apart from the sunburn?`
`item.type`	1..1	`String`	Type of the item, must be set to `display`

1.6.3.2.2.2 Questionnaire for body map questions

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the questionnaire
`resourceType`	1..1	`String`	Type of resource, must be set `Questionnaire`
`identifier`	0..*	`Array`	Identifiers for the questionnaire
`identifier[0].value`	1..1	`String`	Question ID or Bodymap
`identifier[1].value`	1..1	`String`	Pathway ID, is not set for bodymap

Field	Cardinality	Type	Description
`identifier[2].value`	1..1	`String`	Order number, is not set for bodymap
`status`	1..1	`String`	Status of the questionnaire, must be set to `active`
`subjectType`	0..*	`Array`	Types of subjects, set to `Patient`
`item`	0..*	`Array`	List of grouped body parts/areas
`item.linkId`	1..1	`String`	Name of the body area group
`item.type`	1..1	`String`	Must be set to "`group"`
`item.item`	0..1	`String`	Text of the item, e.g., `15`, `14`, `13`, `4`, etc.

Questionnaire items for body area choices

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Name of body part
`item.type`	1..1	`String`	`Must be set to "display"`
`item.text`	0..1	`String`	Text of the item, e.g., `15`, `14`, `13`, `4`, etc.
`item.item`	0..*	`Array`	Pathways for selection

Questionnaire items for pathways from bodymap

Field	Cardinality	Type	Description
`item.linkId`	1..1	`String`	Pathway id e.g. "PW500"

Field	Cardinality	Type	Description
`item.type`	1..1	`String`	`Must be set to "group"`
`item.text`	0..1	`String`	Pathway title
`item.item[0].linkId`	1..1	`String`	Must be "doUseText"
`item.item[0].type`	1..1	`String`	Must be "display"
`item.item[0].text`	0..1	`String`	Must be the value of the "KP_Use" filed from Pathways table
`item.item[1].linkId`	1..1	`String`	Must be "doNotUseText"
`item.item[1].type`	1..1	`String`	Must be "display"
`item.item[1].text`	0..1	`String`	Must be the value of the "KP_NotUse" filed from Pathways table

1.6.3.2.3 ServiceRequest Resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the service request
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Disposition (see page 238), symptomGroup and symptomDiscriminator from triage engine "

Field	Cardinality	Type	Description
`resourceType`	1..1	`String`	Type of resource, must be set to `ServiceRequest`
`status`	1..1	`String`	Status of the service request, must be set to `active`
`intent`	1..1	`String`	Intent of the service request, must be set to `proposal`
`code.concept.text`	1..1	`String`	Text of the code concept, e.g., Outcome (must be set if using OrderDetail as per FHIR spec for ServiceRequest
`subject.identifier.system`	1..1	`String`	System of the subject identifier, e.g., `http://fhir.nhs.uk/Id/patient`
`subject.identifier.value`	1..1	`String`	Value of the subject identifier, e.g., `b8c6686b-846e-4582-8a2c-e60e8397ba51`
`orderDetail`	0..*	`Array`	List of order details
`orderDetail[x].coding[0].code`	1..1	`String`	ID of the the outcome e.g., `SG1158`, `SD4049`, `Dx012`
`orderDetail[x].coding[0].display`	1..1	`String`	Display text of the outcome type, e.g., `symptomGroup`, `symptomDiscriminator`, `disposition`

Field	Cardinality	Type	Description
`orderDetail[x].text`	1..1	`String`	Text value of the outcome, e.g., `Sunburn`, `AMB heat stroke`, `Emergency Ambulance Response (Category 3)`

1.6.3.2.4 Communication Resource

Field	Cardinality	Type	Description
`id`	1..1	`String`	Unique identifier for the communication
text.status	1..1	`String`	Must be "generated"
text.div	1..1	`String`	Div containing narrative text of task, e.g. "<div xmlns=\"http://www.w3.org/1999/xhtml\">Care (see page 238) advice from triage engine "
`resourceType`	1..1	`String`	Type of resource, must be set to `Communication`
`status`	1..1	`String`	Status of the communication, must be set to `completed`
`payload`	0..*	`Array`	List of care advice items
`payload.contentString`	1..1	`String`	Care advice text, e.g., `Rest somewhere cool.`, `Cool the skin by sponging with lukewarm water or having a tepid (not cold) bath or shower. Don't use ice.`, `Take care not to get too cold.`, `Have plenty of non-alcoholic drinks to help cool down and to prevent dehydration.`

1.7 NPT-003 Options Analysis

1.7.1 Summary

	FHIR Bundle	FHIR Task		Custom JSON
		Stateful	Stateless	
Statefulness	Stateless	Stateful	Stateless	Stateless
Payload	Acceptable	Acceptable	Acceptable	Smallest
Compliance	Contentious	Compliant	Compliant	Acceptable
Onboarding	non-differentiating			
Rehydration	Easy	Tricky	Easy	Easy
Readability	Least	Moderate	Moderate	Most
Tooling Support	non-differentiating			
Validation	non-differentiating			
Extensibility	Less	Less	Less	Most

1.7.2 Statefulness

FHIR Bundle	FHIR Task		Custom JSON
	Stateful	Stateless	
Stateless	Stateful	Stateless	Stateless

Statefulness is the property of a service keeping track of an ongoing business process across multiple upstream messages.

Statefulness impacts Payload sizes in that stateful solutions will not need to communicate the whole triage history.

Statelessness facilitates rerouting of triage traffic to other hosts / regions.

Stateless APIs are easier to build and maintain, and the provider software is already maintaining triage state.

1.7.3 Payload

FHIR Bundle	FHIR Task		Custom JSON
	Stateful	Stateless	
Acceptable	Acceptable	Acceptable	Smallest

This is a heuristic for network traffic and associated costs. The **FHIR Bundle** and **FHIR Task (stateless)** approaches have large payloads, and grow proportionately with progress through the triage (i.e., the payload is larger at the end of a triage compared with the start). The **Custom JSON** approach also grows as the triage progresses, but with a much smaller payload. The **FHIR Task (stateful)** approach on the other hand also has a large payload because of the FHIR format, but does not grow with the triage. The ideal (small, O(1)) is not achieved by any approach.

The various payloads are not expected to be significantly impactful.

We compared each option with equivalent information content:

Information payloads for juxtaposition...

- **Patient:**
  - **Age:** 35
  - **Sex:** female
- **Operator skillset:** 111 Call Handler
- **Party:** 3rd party
- **Version:** 48.2.0

And the following messages:

- **Requests:**
  - **RQ1: Starting a triage**
    age: 35
    gender: female
    party: 3rd party
    requested version: 48.2.0
    operator skillset: 111 Call Handler

  - **RQ2: Answering the first question**
    TX220074: 7

  - **RQ3: Answering a full set of questions**
    TX22074: 7

TX220664: 3
TX220998: 1

- **Responses:**
  - **RS1: 1x (first) question, 0x care advice, 0x outcome**
    Question ID: TX220074
    Question Text: "What is the reason for the contact?"
    Question Hint: "To find out the reason for the contact and where to direct it."
    Answers:
    1. "an injury or other health problem" (Hint: "This means a new health problem or any existing problem that has worsened.\nAn increase in the use of medication may hide an existing problem that is worsening.\nThis means an individual who has swallowed or breathed in something potentially poisonous but is symptom-free.\nThis does not mean an individual who is symptom-free but requires information.")
    2. "labour or childbirth" (Hint: "This means waters breaking, increasingly frequent contractions, seeing or feeling the baby coming. This also means that a baby has just been born. DO NOT SELECT THIS ANSWER if the individual has gone into labour following an injury to the abdomen, lower back, groin or genitals. Select 'an injury or other health problem' instead.")
    3. "a community service" (Hint: "This means a palliative care team, community nurses, district nurses, community midwives, falls team, rapid response team or another OOH service.")
    4. "a healthcare professional requesting contact with another clinician" (Hint: "This means that a healthcare professional needs to speak with another clinician.")
    5. "a report of results or tests" (Hint: "This means a report of results of blood tests, X-rays, ECGs, or any other test.\nThis does not mean a contact about an individual who has symptoms.")
    6. "a possible failure of contraception" (Hint: "This means the individual is concerned about accidental pregnancy. They may have failed to use contraception, run out of/missed pills, or a condom may have split or come off, or had a problem with a contraceptive device. \nThis does not mean an individual with symptoms such as vaginal bleeding or discharge. Select illness or injury option.")
    7. "more" (Hint: "This will take you to a further menu: \nChild protection or vulnerable adult concern, social or domestic emergency, prescription or appointment request and a request

for health information.")

- **RS2: 1x question, 1x care advice, 0x outcome**
  Question ID: Tx220668
  Question Text: "Is there anything that might be a head louse or nit in the hair?"
  Question Hint: "To find out if head lice might be present."
  Answers:
  1. "yes" (Hint: "This means head lice or nits can be seen in the hair.\nHead lice are tiny grey-brown, wingless insects which may be seen moving in the hair.\nTheir eggs (known as nits) are tiny white specks stuck to the base of hairs.")
  2. "not sure"
  3. "no"
  Care advice:
  Text: "Head lice is common. Speak to a pharmacist for advice on suitable treatments."

- **RS3: 1x question, 3x care advice, 1x outcome**
  Question ID: Tx220357
  Question Text: "Does she seem generally unwell, apart from the sunburn?"
  Question Hint: "To find out if the child seems to be unwell, as well as sunburned."
  Answers:
  1. "yes"
  2. "not sure"
  3. "no"
  Care advice:
  Text: "Rest somewhere cool."
  Text: "Cool the skin by sponging with lukewarm water or having a tepid (not cold) bath or shower. Don't use ice. Take care not to get too cold."
  Text: "Have plenty of non-alcoholic drinks to help cool down and to prevent dehydration."
  Outcome:
  SG1158: "Sunburn"
  SD4049 "AMB heat stroke"
  Dx012: "Emergency Ambulance Response (Category 3)"

1.7.4 Compliance

FHIR Bundle	FHIR Task		Custom JSON
	Stateful	Stateless	
Contentious	Compliant	Compliant	Acceptable*

How well does the approach align with standards in place within NHSE?

The Bundle resource is questionable. BaRs sets a precedent, but it's contentious.

Interops team has said custom payloads are viable with enough documentation.

Custom approach may require a FHIR adapter for interoperability with e.g. BaRs.

FHIR Task approaches line up better with what we're trying to do than with a FHIR Bundle.

* The approach is acceptable *iif* we have sufficient reasons.

1.7.5 Onboarding

FHIR Bundle	FHIR Task		Custom JSON
	Stateful	Stateless	
non-differentiating			

This metric attempts to predict how difficult it would be for suppliers to integrate using each approach.

For providers new to FHIR, those approaches could be daunting.

But providers need to integrate with many healthcare services so they are likely to have to consume & provide FHIR anyway.

This metric is seen as non-differentiating.

1.7.6 Rehydration

FHIR Bundle	FHIR Task		Custom JSON
	Stateful	Stateless	
Easy	Tricky	Easy	Easy

Rehydration is the practice of returning to a prior state by importing the data needed.

Main question: how relatively impactful is the ability to rehydrate?

The main differentiator is statefulness; a stateful server would need extra effort and/or comms to facilitate rehydrating a triage from elsewhere.

1.7.7 Readability

FHIR Bundle	FHIR Task		Custom JSON
	Stateful	Stateless	
Least	Moderate	Moderate	Most

For the sake of communication within the team and with stakeholders familiar with the domain, how readable are the payloads?

Custom approach is the most readable.

The different FHIR approaches are comparable with each other, with the Task approaches having a slight advantage because related content are grouped more clearly together.

1.7.8 Tooling Support

	FHIR Task		
FHIR Bundle	**Stateful**	**Stateless**	**Custom JSON**
non-differentiating			

Options where off-the-shelf libraries can be used to assist with the creation and parsing of messages are deemed favourable.

The complexity of FHIR is mitigated by having dedicated tooling support. Custom approach doesn't have anything special but has less need for it.

Short-lived benefit during creation. Longer-term for updates and maintaining quality.

Each approach has an appropriate level of tooling support, so this consideration is not considered to be a differentiator.

1.7.9 Validation

	FHIR Task		
FHIR Bundle	**Stateful**	**Stateless**	**Custom JSON**
non-differentiating			

Options where off-the-shelf libraries can be used to assist with validation of messages are deemed favourable.

Similar to tooling, each approach has an appropriate level of tooling support, so this consideration is not considered to be a differentiator.

1.7.10 Extensibility

	FHIR Task		
FHIR Bundle	**Stateful**	**Stateless**	**Custom JSON**
Less*	Less	Less	Most

As the service evolves over time we can anticipate that the payloads for communication between clients and the TaaS API may also need changes.

* Task approaches are slightly easier to extend than the Bundle.

Unclear if we would be extending in ways in which FHIR aligns well.

Custom offers the most flexibility.

1.8 Triage Engine API Response Review

Linked ticket: [6] NPT-515[7] - API: FHIR data model review DONE

1.8.1 Fields from Pathways and Triage engine

1.8.1.1 Fields from Pathways and Triage Engine

These fields are provided in FHIR responses and typically include questions and dispositions fields.

Field	Type	FHIR Field
symptomGroup	Integer	ServiceRequest.orderDetail.parameter.code.coding.code {symptomGroup}
symptomDiscriminator	Integer	ServiceRequest.orderDetail.parameter.code.coding.code {symptomDiscriminator}
disposition	Text	ServiceRequest.orderDetail.parameter.code.coding.code {disposition}
pwId	Text	Questionnaire.identifier[1].value
orderNo	Integer	Questionnaire.identifier[2].value
clinicalAreaId	Integer	Task.input.valueString {clinicalArea}
quID	Text	Questionnaire.item.linkId
answerNo	Integer	Questionnaire.{QuestionId}.x.group

6. https://nhsd-jira.digital.nhs.uk/browse/NPT-515
7. https://nhsd-jira.digital.nhs.uk/browse/NPT-515?src=confmacro

1.8.1.2 Fields Referencing Pathways via Reference Data

These FHIR request fields require valid values are used, which can be made available via the API specification.

Field	Type	FHIR Field
ageGroupId	Integer	Task.input.valueString {ageGroup}
ageInYears	Integer	Task.input.valueString {ageYear}
genderId	Integer	Task.input.valueString {gender}
partyId	Integer	Task.input.valueString {party}
chSkillsetId	Integer	Task.input.valueString {skillset}

1.8.2 IDT (CQI) API Fields

1.8.2.1 From triage engine (to be returned in API responses)

Field	Type	Required in IDT request	FHIR Field
symptomGroup	Integer	Required if available	ServiceRequest.orderDetail.parameter.code.coding.code {symptomGroup}
symptomDiscriminator	Integer	Required if available	ServiceRequest.orderDetail.parameter.code.coding.code {symptomDiscriminator}
pwId	Text	Required	Questionnaire.identifier[1].value
orderNo	Integer	Required	Questionnaire.identifier[2].value

1.8.2.2 From consuming systems

1.8.2.2.1 From the triage engine and/or pathways reference data

1.8.2.2.1.1 Case Record Fields

Field	Type	Required in IDT request	FHIR Field
ageGroupId	Integer	Required	Task.input.valueString {ageGroup}
ageInYears	Integer	Required if available	Task.input.valueString {ageYear}
genderId	Integer	Required	Task.input.valueString {gender}
partyId	Integer	Required	Task.input.valueString {party}
chSkillsetId	Integer	Required if applicable	Task.input.valueString {skillset}
chTriageDispoCode	Text	Required if applicable	ServiceRequest.orderDetail.parameter.code.coding.code {disposition}
clinicalAreaId	Integer	Required if applicable	Task.input.valueString {clinicalArea}

1.8.2.2.1.2 Triage Record Fields

Field	Type	Required in IDT request	FHIR Field
quID	Text	Required if applicable	Questionnaire.item.linkId
answerNo	Integer	Required if applicable	Questionnaire.{QuestionId}.x.group
skillsetId	Integer	Required	Task.input.valueString {skillset}

1.8.2.2.2 Stored and managed by the consuming system

1.8.2.2.2.1 Case Record fields

Field	Type	Required in IDT request
siteId	Integer	Required

Field	Type	Required in IDT request
supplierCallRef	String	Required
Postcode	String	Required if available
chUserCode	Text	Required if applicable
chCallStartTime	DatetimeOffset	Required if applicable
chTriageStartTime	DatetimeOffset	Required if applicable
chDispoTime	DatetimeOffset	Required if applicable
chTriageEndTime	DatetimeOffset	Required if applicable
chCallEndtime	DatetimeOffset	Required if applicable
chFinalDispoCode	Text	Required if applicable
chOverrideFlag	Boolean	Required if applicable
dosTransactionId	Uniqueidentifier	Required if applicable
dosStartTime	DatetimeOffset	Required if applicable
dosEndTime	DatetimeOffset	Required if applicable
dosRequestFailId	Integer	Required if applicable
callerType	Text	Required if applicable
callReason	Text	Required if CallerType is populated
nhsNumber	Text	Required if available
journeyId	Uniqueidentifier (8-4-4-4-12 UUID style)	Required
nhsEnglandAreaCode	Text	Required

Field	Type	Required in IDT request
supplierRelease	Text	Required

1.8.2.2.2.2 Triage Record Fields

Field	Type	Required in IDT request
userCode	Text	Required
timeIn	DatetimeOffset	Required
orderNo	Integer	Required
userComment	Text	Required if applicable
actionId	Integer	Required

1.8.2.2.2.3 Services returned fields

Field	Type	Required in IDT request
serviceId	Integer	Required if applicable
serviceOrder	Integer	Required if applicable
serviceStatusId	Integer	Required if applicable
rejectReasonId	Integer	Required if applicable

1.8.3 DOS API Fields

Link to API documentation:

https://developer.nhs.uk/apis/dos-api/index.html

The DOS API has 4 RESTful ways of being queried:

- byServiceType[8]
- byClinicalTerm[9]

8. https://developer.nhs.uk/apis/dos-api/byServiceType.html

- byODSCode[10]
- byServiceId[11]

For `byODSCode` and `byServiceId`, only the ODS Code and Service ID are required, respectively. Since both values originate from the consuming system and are not used within the Triage FHIR API, these endpoints are not analysed further in this document.

The `byServiceType` and `byClinicalTerm` endpoints share most of the same fields, with the key differences being `serviceTypeIds` (used in `byServiceType`) and `symptomGroupDiscriminatorCombos` (used in `byClinicalTerm`). Given the relevance of symptom groups and symptom discriminators, this page focuses on analysing the `byClinicalTerm` endpoint.

1.8.3.1 Sourced from triage engine (to be returned in API responses)

Parameter	Type	Required	Description	FHIR Field
disposition	String	No	Not currently used - ignored if passed	ServiceRequest.orderDetail.parameter.code .coding.code {disposition}
symptomGroup DiscriminatorCombos	Array	Yes	DoS SGSD IDs - format SGID=SDID	ServiceRequest.orderDetail.parameter.code .coding.code {symptomGroup} ServiceRequest.orderDetail.parameter.code .coding.code {symptomDiscriminator}

1.8.3.2 Sourced from consuming systems

1.8.3.2.1 Sent to triage engine via API requests

Parameter	Type	Required	Description	FHIR Field
age	Integer	No	DoS age group of patient: 1 = Adult, 2 = Child, 3 = Toddler, 4 = Neonate & Infant, 8 = Older People	Task.input.valueString {ageGroup}
gender	String	No	Gender of patient: M = male, F = Female, I = Indeterminate	Task.input.valueString {gender}

9. https://developer.nhs.uk/apis/dos-api/byClinicalTerm.html
10. https://developer.nhs.uk/apis/dos-api/byODSCode.html
11. https://developer.nhs.uk/apis/dos-api/byServiceId.html

1.8.3.2.2 Stored and managed by the consuming system

Parameter	Type	Required	Description
caseId	String	No	Case identifier
postcode	String	Yes	Postcode used to calculate search distance
searchDistance	Integer	No	Distance in miles, max 100. Default is 37.5
gpPracticeId	Integer	No	DoS service ID of patient's GP Practice

1.8.4 Repeat caller API Fields

Link to API documentation:

https://developer.nhs.uk/apis/uec-tech-standards/repeat_caller_service.html

All of these fields originate from the consuming system

Parameter	Type	Required	Used with triage engine	FHIR Field	Description
Verified NHS Number	String	No	No		only included if person is verified against the PDS, if included, will be used as primary search key
First Name	String	Yes	No		
Last Name	String	Yes	No		
Date of Birth	String	Yes	Could be used to derive age/ age group	Task.input.valueString {ageGroup}	

Parameter	Type	Required	Used with triage engine	FHIR Field	Description
Gender	String	Yes	Yes	Task.input.valueString {gender}	Value for genders are not explicitly defined in API documentation Likely to be male, female and unknown, similar to other NHS APIs
Postcode	String	Yes	No		

1.8.5 Booking / Referral Fields

Link to API documentation:

https://digital.nhs.uk/developer/api-catalogue/booking-and-referral-fhir/v1.3.0#get-/Appointment

The **Booking and Referral FHIR API** provides several endpoints and methods for retrieving, updating, and creating:

- Bookings
- Documents
- Healthcare services
- Organisations
- Referrals

Most of these methods require specific IDs, meaning they do not overlap with the Triage Engine. The fields highlighted below are FHIR objects that use patient demographics and organisation information, which will be used by both the consuming systems and the Triage Engine.

1.8.5.1 Headers

Parameter	Type	Required	Used with triage engine	FHIR Field	Description
NHSD-Target-Identifier	byte	required if applicable			The identifier of the Target system. A Base64 encoded object containing value and system properties.
NHSD-End-User-Organisation	byte	required if applicable			Requesting Organisation described in an object based on a FHIR 'Organisation' resource (Standard Base64 encoded JSON).

1.8.5.2 Patient/subject

Parameter	Type	Required	Used with triage engine	FHIR Field	Description
identifier	string	No (only required as the subject.identifer for retrieving patient's document pointers (GET)[12])	No		The patient's NHS number.
name	string	No	No		The patient's name, including family, given, prefix, suffix and/or text.
birthdate	string	No	Could be used to derive age/age group	Task.input.value String {ageGroup}	The patient's Date of Birth.
address-postalcode	string	No	No		The patient's Home address Postcode.

12. https://digital.nhs.uk/developer/api-catalogue/booking-and-referral-fhir/v1.3.0#get-/DocumentReference

1.8.5.3 HealthcareService/Custodian

Parameter	Type	Required	Used with triage engine	FHIR Field	Description
providedBy	string	No	No		The identifier of the organization that is managing the endpoint(s). ODS Organization Code
identifier	string	No	No		The identifier of the HealthcareService. DOS Service ID

1.8.5.4 Organisation

Parameter	Type	Required	Used with triage engine	FHIR Field	Description
identifier	string	No	No		The identifier of the HealthcareService. DOS Service ID

1.8.6 Post-Event Message

Link to documentation:

https://developer.nhs.uk/apis/uec-tech-standards/post_event_messaging.html#itk-should-be-used-where-possible

The **Post Event Message (PEM) specification** outlines the required content for post-event messages. Key points include:

- ITK should be used where possible
- “For Action” messages should contain the DoS Service ID
- “For Information” messages should contain the ODS Code
- PEM should not be sent when the patient is referred to specific services e.g. Out of Hours (OOH)
- PEM must contain the correct sections and headings
  - `a. Patient’s Reported Condition;`
  - `b. Pathways Disposition (this should include selected service);`
  - `c. Consultation Summary;`

- `d. Pathways Assessment;`
- `e. Advice Given`

For the **Triage API**, it acts as a component of the consuming system. Calls to other UEC services (such as the DOS API) are made by the consuming system, not the Triage API. As a result:

- The Triage API will **not have access** to the DoS Service ID returned by the triage engine.
- It will also **not have access** to other information such as the ODS Code or referral details (e.g., whether the triage leads to an Out of Hours service, which may be inferred from the skillset).

Therefore, the responsibility for generating and sending **post-event messages** lies with the **consuming system**, not the Triage API.

2 NPT-008 - Pathways Triage API (Beta)

2.1 NPT-008 - Triage API (Beta)

Document Status	APPROVED	**Delivery Team** • Design author: Tharack Ahmed • Architect accountable: Afzal Mufti Tharack Ahmed • Security Lead: • Business Analyst: Tracy Higgs • Development Lead: Andrew Walker • Designer: • Platform Engineer: • QA Lead: • Reviewers:

0.1	13 Oct 2025	Tharack Ahmed	Draft	DRAFT
1.0	19 Nov 2025	Tharack Ahmed , Afzal Mufti	TRG Approval	APPROVED

2.1.1 Problem Statement

The existing NHS Pathways platform underpins triage for NHS 111 and 999 services but operates on legacy, tightly coupled architectures that restrict scalability, maintainability, and interoperability. Suppliers integrate Pathways content in differing ways, leading to inconsistency in triage outcomes, repeated assessments downstream, and operational inefficiencies.

There is a need to establish a **modern, stateless, and versioned triage API** that:

- Enables standardised integration across suppliers.
- Provides version-controlled, clinically governed triage logic.
- Supports scalability for national call volumes.
- Integrates with NHS England's API Management (APIM) for secure supplier access.
- Embeds observability, auditability, and governance as first-class design features.

2.1.2 Design Proposal

Business		Responsible (RACI)
Business Change	The current triage technology landscape must evolve to support modern integration patterns, improved resilience, transparent versioning, and reduced burden on suppliers. A modern API approach is required to: • Expose triage capabilities securely and consistently • Scale to national demand for both 111 and 999 services • Allow multiple versions of clinical content to run in parallel • Enable audit and clinical safety verification at scale • Support Pathways transformation and future TOM evolution	Tracy Higgs
High Level User Experience	1. A triage is initiated by an upstream service sending an HTTP message providing the skill-set of the handler and basic demographics of the patient (age, sex, and party). Note that the patient's location is not needed, but upstream services are expected to continue to gather that information for later, in case it is needed. 2. The system derives the initial pathway to use from these data and presents the first question back to the upstream service in response. 3. The triage is continued by the upstream service presenting that question to the patient, collecting the answer, and sending an HTTP message to the system with all of the previous data (skill-set and demographics) plus a reference to the question already asked and its answer. 4. The system is stateless, and questions can appear in multiple pathways, so it replays what it did for the opening request to work out which pathway is needed, but then instead of asking the first question again it sees that an answer has been supplied and automatically follows the pathway to its next configured question and supplies that. 5. The triage continues with this loop, with each request supplying all of the questions and answers relayed so far to the patient. 6. The system may supply: zero or one questions, which may in a special case be the body map; any number of care advice items; zero or one outcomes.	

Architecture

Technical Change	**Objectives** • Deliver a stateless, secure, scalable triage API through NHS API Management • Ensure clinical auditability and full traceability of care recommendations • Enable multiple Pathways content versions to run concurrently • Apply consistent versioning, lifecycle and deprecation governance • Integrate with NHS governance and assurance processes • Maintain strict latency and availability SLOs suitable for clinical services **Success Criteria** • Less than 150ms p95 end-to-end latency (target) • 99.9% availability (monthly) • Zero avoidable clinical safety incidents • Secure API onboarding and version negotiation via APIM • Content version lifecycle governance implemented • Full UUID-based traceability for audit and supplier queries • Validated disaster recovery pattern and rollback capability • Approved through both clinical and technical governance	
Options Considered	**OPTIONS WERE CONSIDERED IN PREVIOUS ODP:** NPT-003 - Triage as a Service API PoC (see page 6)	
Option 1	A stateless triage API, fronted by NHS API Management, backed by AWS hosting and DynamoDB for content storage.	

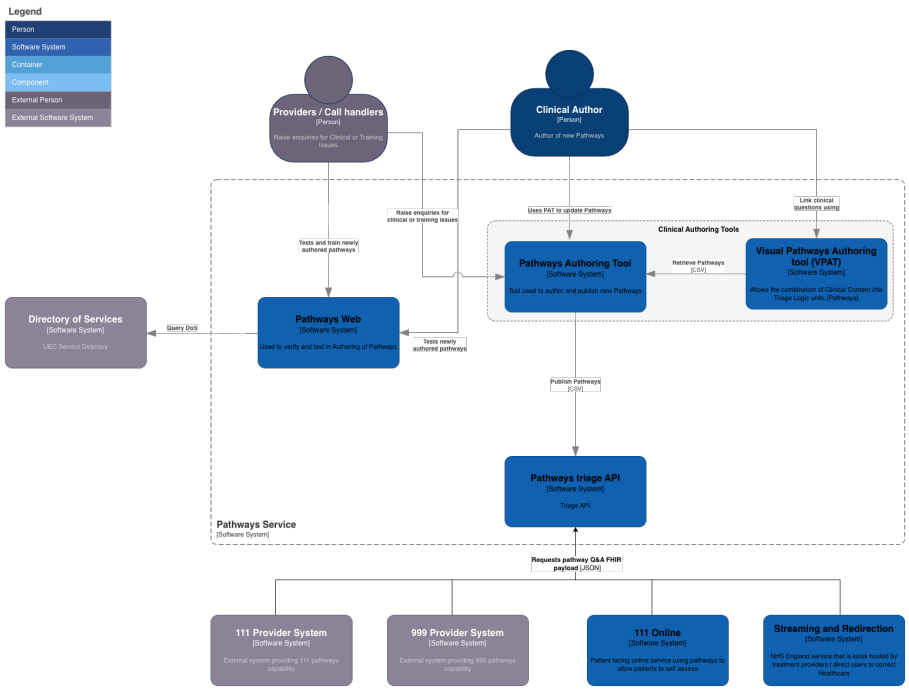

Selected Option	**A stateless triage API, fronted by NHS API Management, backed by AWS hosting and DynamoDB for content storage.** **In Scope** • Stateless triage API • NHS APIM onboarding and routing • AWS deployment architecture • DynamoDB data model for Pathways content • Version registry and version negotiation • Monitoring and observability • Release and rollback processes • DR and business continuity design **Out of Scope** • Authoring tooling design • Clinical content creation or modification • Downstream service referral orchestration (covered separately under TOM)

2.2 7.1.2.2.9.1 - Triage self managed versioning architecture

- Objective
- Approach
- Pros / Cons

2.2.1 Objective

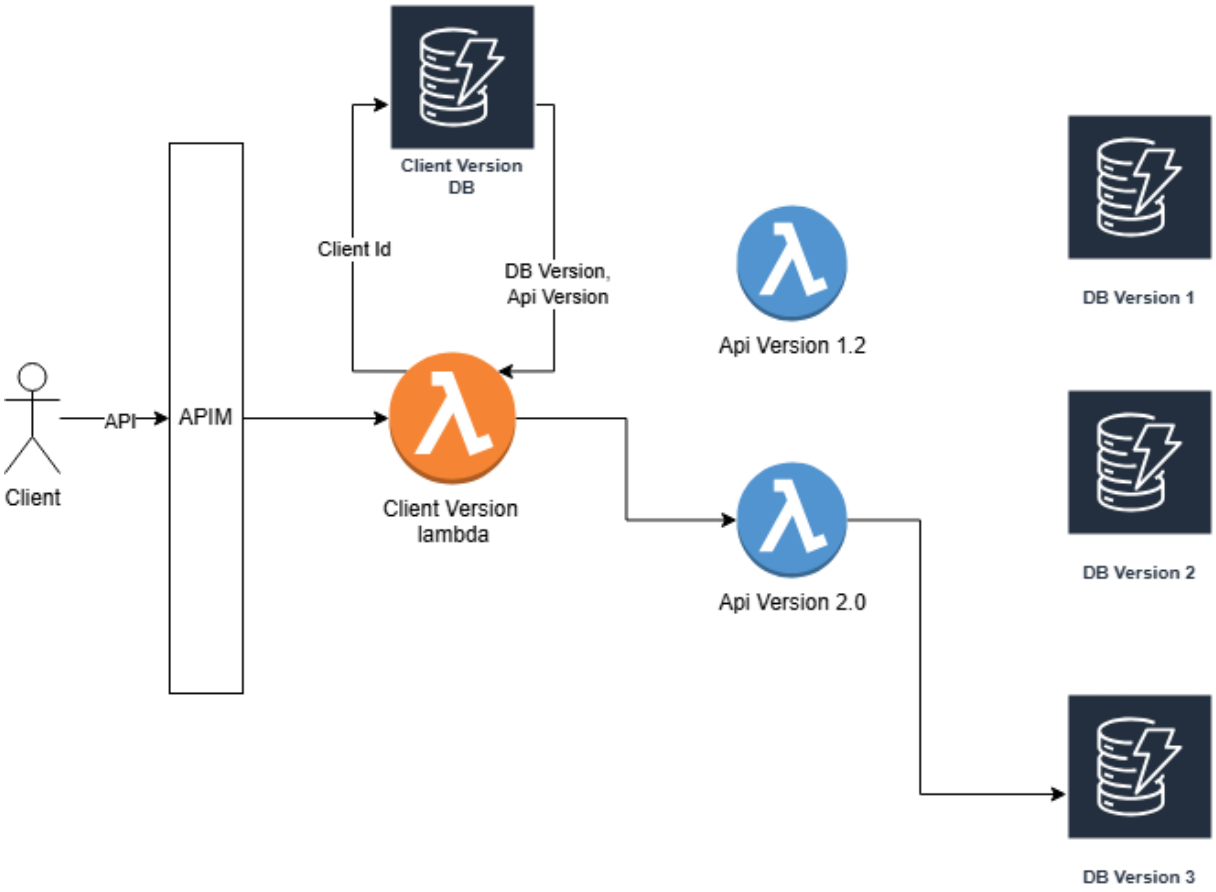

To enable the triage API to automatically determine the correct API version and client data version for each user—without requiring providers to explicitly supply these values. This approach removes the dependency on providers to pass the API and client data versions. Instead, the configuration details would be stored within the API solution and associated with the client ID, allowing the system to retrieve them whenever a provider accesses the API. This centralizes configuration data in one location and reduces the number of lookups needed.

2.2.2 Approach

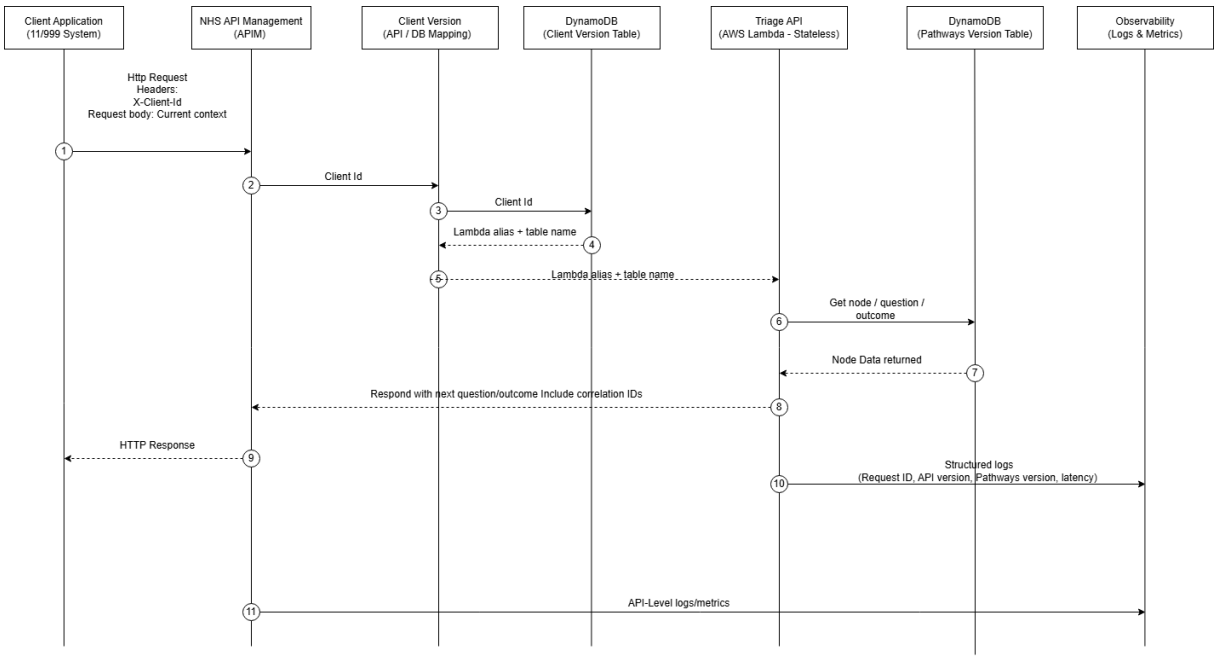

The provider supplies the Clients Id and the API version and the Client version is stored on the system and looked up.

1. Provider call the API with the Client Id in the header
2. A lambda takes the Client Id and looks up the Client Data version and the API version for that provider
3. The provider is directed to the correct API and version
4. The Client data version directs the API version to the correct client data version table.

2.2.2.1 Provider the supplies the API version and the Client version Id

2.2.2.2 Timeline

2.2.3 Pros / Cons

2.2.3.1 Pros

- A single database lookup returns both the API version and the client data version.
- Providers cannot supply invalid or mismatched API and client data version combinations.
- Versioning is centrally controlled and managed.
- Offers the option for further extensibility in future.

2.2.3.2 Cons

- Configuration must be set up ahead of any migration or upgrade to a newer version.
- Providers must provide their API and client data version details before they can complete a migration.
- Additional workload for the triage team to update provider records when moving them to newer versions.
- More processing required to get the clients configuration each time they access the api.

2.3 7.1.2.2.9.2 - Design Document - Triage API

2.3.1 Document Control

Field	Entry
Document Title	Design Document - Triage API
Version	v1.0 (Draft)
Date	13 October 2025
Authors	Architecture & Engineering – SaET Team
Reviewers	NHSE Digital Urgent and Emergency Care (DUEC) SMT, Clinical Safety Team, API Management Team
Approvers	NHSE Architecture Review Board / DUEC SMT
Status	Draft for Review
Related Documents	ADR-API-001 to ADR-API-018 inclusive; NHS England API Management Standards; DSPT Compliance Guidelines
Confidentiality	Internal – NHS England Use Only

2.3.2 Purpose and Background

2.3.2.1 **2.1 Purpose**

This Open Design Proposal defines the overarching architecture for the Triage API, the national service enabling NHS 111 and 999 systems to deliver consistent triage outcomes via standardised, machine-readable interfaces.
It consolidates individual Architectural Decision Records (ADRs API-001 – API-018) into a coherent end-to-end design for review and approval by NHS England's governance boards.

The ODP provides a single point of reference for architectural intent, operational design, governance alignment, and future scaling strategy.

2.3.2.2 **2.2 Background**

The existing NHS Pathways platform underpins telephone and online triage across urgent and emergency care. However, it operates on legacy architectures that limit scalability, maintainability, and

interoperability.
Suppliers currently consume triage content in fragmented ways, resulting in inconsistent integration and repeated downstream triage.

The Triage API modernises this ecosystem by:

- Providing a stateless, versioned API for triage question-and-answer flows.
- Enabling reproducible, clinically governed outcomes through Pathways content versioning.
- Integrating with NHS England API Management (APIM) for secure and consistent supplier access.
- Leveraging cloud-native AWS infrastructure for scalability and resilience.
- Embedding observability, governance, and clinical safety by design.

2.3.3 3 Objectives and Design Principles

2.3.3.1 3.1 Objectives

The Triage API aims to deliver a standardised, scalable, and clinically safe platform for triage outcomes across NHS 111 and 999.
It will allow suppliers and systems to consume triage pathways securely, reliably, and consistently.

1. Support clinical reproducibility – ensure outcomes are traceable to specific API and Pathways versions.
2. Deliver scalability and resilience – support national demand and maintain consistent performance under load.
3. Ensure clinical and information governance compliance – align with DSPT, ISO 27001, and NHS API Management standards.
4. Facilitate operational observability – provide full visibility for technical and clinical monitoring.
5. Support continuous improvement – enable controlled evolution of triage logic and content without breaking integrations.
6. Enable interoperability (future phase) – prepare for SNOMED CT alignment and wider NHS interoperability frameworks.

2.3.3.2 3.2 Design Principles

Principle	Description
Stateless by Design	The API maintains no session state. Consumers manage conversation state for scalability and simplicity.
Versioned and Reproducible	Both the API and Pathways content are versioned to ensure auditable and traceable outcomes.

Principle	Description
Secure by Default	Authentication via NHS APIM using OAuth 2.0 / JWT; encryption enforced in transit and at rest.
Clinically Governed	All content and releases undergo clinical safety review before deployment.
Scalable and Resilient	Built on AWS multi-AZ architecture with auto-scaling and redundancy.
Observable and Measurable	Full telemetry (logs, metrics, alerts) to support governance and operations.
Reusable and Extensible	Modular design supports future triage models and clinical domains.
Compliant with NHS Standards	Conforms to NHS API Management, DSPT, and Cyber Security principles.
Automated and Auditable	CI/CD pipelines enforce controlled, traceable deployments.

2.3.4 4 High-Level Architecture Overview

2.3.4.1 4.1 Overview

The Triage API exposes a secure, stateless endpoint for triage question-and-answer sequences, returning structured care advice and recommended settings.
It is deployed in a multi-AZ AWS environment, fronted by NHS England API Management (APIM), and backed by a version-controlled data layer hosted in DynamoDB.
Pathways content is ingested through a controlled pipeline with governance approval and version tracking.

[Placeholder – High-Level Architecture Diagram]

2.3.4.2 4.2 Architectural Components

Component	Description
NHS API Management (APIM)	Central entry point for all supplier requests. Manages authentication, authorisation, and rate limits.
Triage API Layer	Stateless service processing triage logic using versioned Pathways content.

Component	Description
Pathways Ingestion Pipeline	Loads validated Pathways content into the Triage database; supports versioning and rollback.
Pathways Database (DynamoDB)	Stores versioned triage content; supports rapid retrieval and point-in-time recovery.
Monitoring and Observability Stack	Collects logs, metrics, and traces using CloudWatch, X-Ray, and Splunk/Odin.
Metrics and Alerting	Implements SLIs/SLOs and severity-based alerting for operational and clinical monitoring.
Release Pipeline (CI/CD)	Automates build, test, deployment, and rollback with governance gates.
Disaster Recovery and Backup Services	Ensures continuity with multi-AZ redundancy and recovery testing.
Supplier Integrations	Approved supplier systems (111/999) access API via APIM using secure tokens.

2.3.4.3 **4.3 Integration Points**

- Upstream: Pathways authoring tools via ingestion pipeline.
- Downstream: Supplier integrations through NHS APIM.
- Cross-system: Observability and governance data routed to NHS enterprise SIEM.
- Future: SNOMED CT-aligned interoperability.

2.3.4.4 **4.4 Key Architectural Characteristics**

Characteristic	Design Approach
Stateless Processing	Each request processed independently.
Traceability	UUIDs link all requests, logs, and data records.
Resilience	Multi-AZ deployment with automated failover.
Scalability	Horizontal scaling through AWS services.

Characteristic	Design Approach
Security	Layered controls: APIM, IAM, encryption, network isolation.
Governance Visibility	Full observability integrated with NHS SIEM.

2.3.5 5 Key Architectural Decisions (ADR Summary)

ADR No.	Title	Decision Summary	Rationale
ADR-API-002	Triage API Hosting Options	Host in NHS England AWS under APIM control.	Ensures scalability and compliance.
ADR-API-003	Communication Format	RESTful JSON over HTTPS.	Aligns with NHS API standards.
ADR-API-004	Integration with Other NHS APIs	Integrate via NHS API gateways using FHIR where applicable.	Improves interoperability.
ADR-API-005	PoC Development Language	Python with FastAPI.	Enables rapid prototyping and maintainability.
ADR-API-006	API Architecture	Stateless, client-managed state, UUID correlation.	Scalable and auditable.
ADR-API-007	API Versioning	Path-based semantic versioning with controlled deprecation.	Ensures stability and traceability.
ADR-API-008	Pathways Content Versioning	Immutable, versioned releases with governance control.	Supports clinical safety and auditability.
ADR-API-009	Authentication Pattern	OAuth 2.0 / JWT via NHS APIM.	Secure and standardised.
ADR-API-010	AWS Infrastructure and Security	Multi-AZ private VPC, IAM, encryption, WAF.	Enhances resilience and compliance.
ADR-API-011	Database Choice	AWS DynamoDB with point-in-time recovery.	High availability and low latency.
ADR-API-012	Data Model	Lightweight, auditable schema.	Maintains governance and reproducibility.

ADR No.	Title	Decision Summary	Rationale
ADR-API-013	Pathways Ingestion	Controlled, version-aware ingestion pipeline.	Ensures content consistency and rollback.
ADR-API-014	Monitoring and Observability	AWS-native tools integrated with Splunk/Odin.	Enables real-time and governance monitoring.
ADR-API-015	Alerts	Severity-based model with escalation paths.	Improves incident response efficiency.
ADR-API-016	Metrics	Metrics catalogue for performance and governance.	Supports assurance and service quality.
ADR-API-017	Release Process	Automated CI/CD with governance gates.	Ensures safe, auditable releases.
ADR-API-018	DR and Business Continuity	Multi-AZ failover and recovery testing.	Guarantees service continuity.

2.3.6 6 Non-Functional Requirements

2.3.6.1 **6.1 Performance and Scalability**

Requirement	Description
Response Time	Average response ≤300 ms; 95th percentile ≤500 ms.
Latency	≤150 ms nominal, ≤250 ms peak; measured across APIM, application, and database layers.
Concurrency	≥10,000 concurrent requests supported.
Throughput	Sustains national peaks without degradation.
Scalability	Horizontal scaling using AWS auto-scaling and adaptive capacity.
Statelessness	Each request is independent, enabling scale and resilience.

2.3.6.2 **6.2 Availability and Resilience**

Requirement	Description
Availability	≥99.95% uptime.
Failover	Automatic across multiple Availability Zones.
RTO	≤1 hour.
RPO	≤5 minutes.
Data Recovery	Point-in-time recovery enabled for all stores.
Testing	Annual DR validation and governance review.

2.3.6.3 **6.3 Security and Compliance**

Requirement	Description
Authentication	Managed through NHS APIM (OAuth 2.0 / JWT).
Encryption	TLS 1.2+ for data in transit; AWS KMS for data at rest.
IAM	Role-based least-privilege model.
Compliance	DSPT, ISO 27001, and NHS API standards.
Logging	UUID-based correlation for every transaction.
Penetration Testing	Annual assessment with defined remediation targets.

2.3.6.4 **6.4 Maintainability and Supportability**

Requirement	Description
Infrastructure as Code	All configurations automated and version-controlled.
Observability	Full telemetry and diagnostic visibility.

Requirement	Description
Dashboards	Real-time API and ingestion monitoring.
Alerts	Severity-based routing and escalation.
Support Model	Tiered operational support with SLAs.

2.3.6.5 6.5 Data Quality and Integrity

Requirement	Description
Version Integrity	Every outcome linked to an immutable content version.
Data Validation	Schema and version checks during ingestion.
Traceability	UUID correlation across systems.
Audit Retention	Logs retained for seven years minimum.

2.3.6.6 6.6 Clinical Safety and Governance

Requirement	Description
Clinical Reproducibility	Identical input and version yield identical outcomes.
Safety Validation	Clinical review before any release.
Governance Oversight	Evidence available for board-level assurance.
Incident Response	All triage-impacting incidents trigger safety review.

2.3.7 7 Operational Design

2.3.7.1 7.1 Overview

Defines operational model for deployment, monitoring, and governance.
Uses cloud-native AWS with Infrastructure as Code and multi-AZ deployment.
Integrates monitoring, release management, and DR as core operational features.

2.3.7.2 **7.2 Deployment Topology**

[Placeholder – Deployment Architecture Diagram]

Layer	Components	Purpose
Edge	NHS APIM	Authentication, authorisation, and routing.
Gateway	AWS API Gateway	Request routing, throttling, and logging.
Application	AWS Lambda / Containers	Executes triage logic statelessly.
Data	DynamoDB	Stores Pathways data and metadata.
Observability	CloudWatch, X-Ray, Splunk/Odin	Captures logs, metrics, and traces.
CI/CD	GitHub Actions, CodePipeline	Automated build, test, and deployment.

2.3.7.3 **7.3 Monitoring and Observability**

Implements hybrid observability (ADR-018) with AWS-native tools and Splunk/Odin integration.
Telemetry includes API metrics, ingestion status, and latency analysis.
Dashboards support operational and governance views with anomaly detection and reporting.

2.3.7.4 **7.4 Alerts and Incident Response**

Severity-based model (ADR-019) with defined escalation paths:

- **Sev 1:** Total outage or clinical impact – immediate escalation.
- **Sev 2:** Performance degradation or ingestion failure – 30 min response.
- **Sev 3–4:** Warnings and info events – monitored and trended.
  Incidents logged in NHS England's central platform and reviewed by clinical safety teams.

2.3.7.5 **7.5 Release and Deployment Process**

Automated CI/CD (ADR-021) with governance gates and rollback capability.
Stages: Build → Validate → Approve → Deploy → Verify → Rollback (if needed).
All releases are version-controlled, auditable, and approved via clinical and governance workflows.

2.3.7.6 **7.6 Disaster Recovery and Business Continuity**

Implements DR strategy (ADR-022) with multi-AZ failover.
RTO ≤1 hour, RPO ≤5 minutes.
Daily backups, annual DR tests, and recovery playbooks under version control.

2.3.7.7 7.7 Operational Roles and Responsibilities

Role	Responsibilities
Engineering Operations	Manage monitoring, incidents, and releases.
Clinical Safety	Oversee outcome safety and release validation.
Information Governance	Data protection and audit retention.
Security Operations Centre	Security monitoring and vulnerability management.
Architecture & Engineering Governance	Oversight, technical compliance, and evolution.

2.3.8 8 Risks, Issues, and Mitigations

Ref	Risk	Impact	Likelihood	Impact Level	Mitigation / Control	Owner
R1	API latency degradation	Slower triage completion during peaks	Medium	High	Auto-scaling, latency budgets, continuous monitoring	Engineering Ops
R2	Pathways ingestion failure	Outdated or missing content	Medium	High	Validation, retries, version rollback	Engineering Ops / Clinical Safety
R3	Incorrect version mapping	Inconsistent outcomes	Low	High	Enforced coupling and automated tests	Architecture
R4	Supplier misuse (state errors)	Incomplete triage flows	Medium	Medium	Clear integration guidance and UUID validation	API Governance
R5	Data integrity loss	Compromised audit trail	Low	High	PIT recovery, 7-year log retention	IG Team
R6	Security breach	Data exposure or misuse	Low	High	OAuth2, IAM, encryption, least privilege	Security Ops
R7	Monitoring failure	Missed incidents	Medium	High	Dual telemetry, quarterly test alerts	Engineering / SOC

Ref	Risk	Impact	Likelihood	Impact Level	Mitigation / Control	Owner
R8	Clinical reproducibility failure	Patient safety impact	Low	High	Version-controlled outcomes and safety testing	Clinical Safety
R9	DR targets missed	Service interruption	Low	High	Multi-AZ, DR testing, defined RTO/RPO	Engineering Ops
R10	Governance delays	Slow release of content/fixes	Medium	Medium	Standardised gates and documentation	Governance
R11	SNOMED CT alignment complexity	Increased integration effort	Medium	Medium	Future extensibility and alignment with TOM	Architecture
R12	External dependency failure	Latency or timeout from NHS APIs	Medium	Medium	Timeout logic, SLAs, dependency monitoring	API Governance

2.3.8.1 8.1 Risk Monitoring and Review

- Risks reviewed monthly (development) and quarterly (steady state).
- Clinical risks reviewed through the Clinical Safety Case.
- Risk register maintained within the Triage API governance workspace.
- New or escalated risks reported to the DUEC Governance Board.

2.4 7.1.2.2.9.3 Triage versioning

- Objective (see page 367)
- Approach
- Pros / Cons

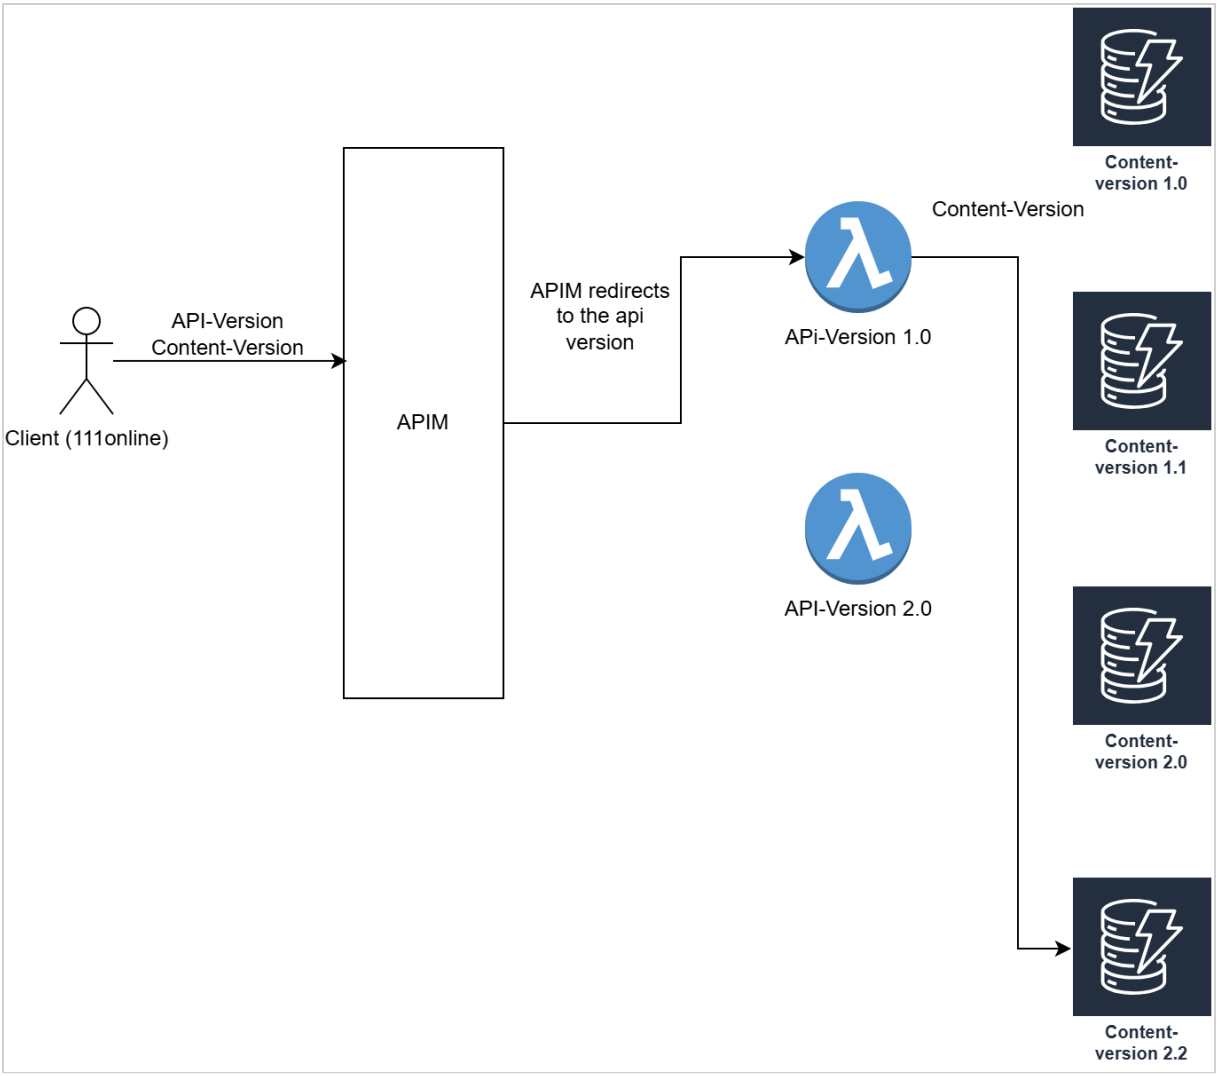

2.4.1 Objective

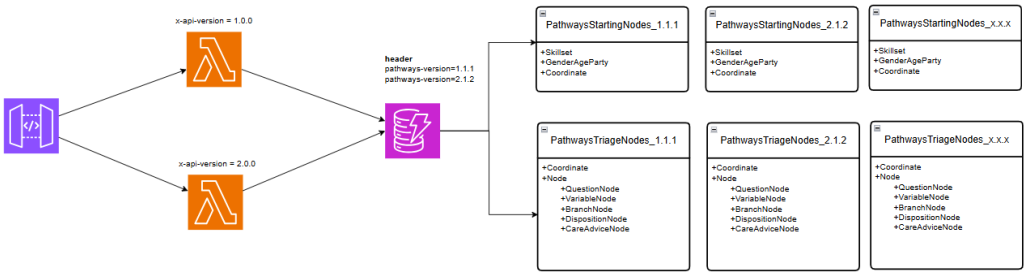

To enable the triage API to automatically determine the correct API version and client data version for each user, it will be the responsibility of the client to supply the correct api and content version. This approach will allow for more flexibility for the client, allowing the client to decide when they want to move to the next version. The client will be directed to a version of the business logic that matches the version they have in the header. The business logic will use the content version number from the header to direct what logic to a specific DynamoDB table.

2.4.2 Approach

The provider supplies the API-Version and Content-Version and APIM redirects the client to the correct Api version.

1. Provider call the API with the API-Version and the Content-Version in the header
2. APIM reads the API-Version and directs the client to the corresponding lambda.
3. If the API-Version is not present an error is returned.
4. The lambda function will read the content-version from the header to will then use the corresponding DynamoDB tables

2.4.3 Versioning policy

Only Major development changes will result in a new lambda version being created. If there are minor changes to the logic e.g. non breaking changes the current version of the lambda will be updated. The develop will be using semantic versioning which is documented here[31]. This will version releases as listed below.

Given a version number **MAJOR.MINOR.PATCH,** increment the:

1. **MAJOR** version when you make incompatible API changes
2. **MINOR** version when you add functionality in a backward compatible manner
3. **PATCH** version when you make backward compatible bug fixes

How this will work with multiple lambdas:

- A major change is developed - this will result in a new lambda being created with a new version number. This means that the clients would only be able to use this lambda if they change the API-Version to match the new lambda version. This means that users will not unintentionally move to a breaking version of the lambda and continue using the version that works for them. e.g. current version **3**.1.6 → **4**.0.0 would result in a new lambda version and corresponding Api-version.
- A minor version is developed - this will result in the current lambda being updated and will **not** result in a new version of the lambda being created. The client will continue to use the existing updated version of the lambda with the same Api-Version e.g. 3.**1**.6 → 3.**2**.6
- A patch version is developed - this will work the same as the minor version.

31. https://nhsd-confluence.digital.nhs.uk/spaces/NPR/pages/1244175590/Development+and+Release+Processes#DevelopmentandReleaseProcesses-VersioningStrategy

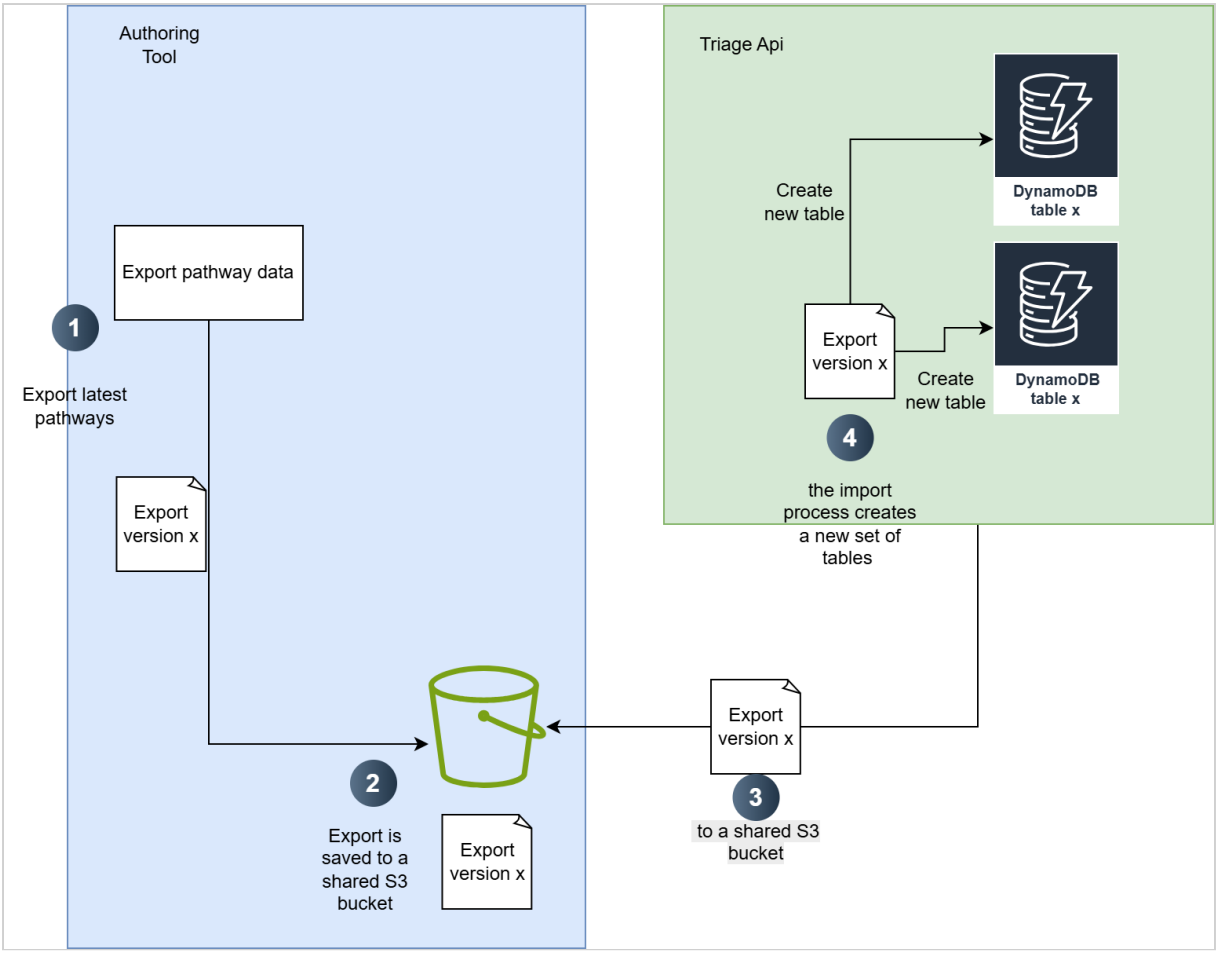

The Api-Version that is supplied by the client should match the major version of the lambda code. Clients will always be on the latest version of the major version of the code and will not be able to specify what minor or patch version they wish to use.

2.5 7.1.2.2.9.4 Data Ingestion

2.5.1 Overview

As part of the triage api the pathways data will need to be updated and new versions will need to be created. The source of the new pathways will be the the pathways authoring tool. The authoring tool will have to export the new pathways version to a S3 bucket that both the authoring tool and the triage api will have access to. This can be done manually or on a scheduled this needs to be confirmed.

2.5.2 Architecture

1. The Authoring tool will export the latest version of the pathway from the authoring tool
2. The exported file will be saved to the S3 bucket
3. The triage Api will check the S3 bucket for new export versions.
4. When a new version is discovered the triage Api will pickup the file and process the file.
5. The triage api will check if there is already an existing version of the pathway.
6. If there is not an existing version a new set of DynamoDB tables will be create and populated with the new pathways data.
7. When a client calls the Api with this pathways version number they will then be directed to this version.

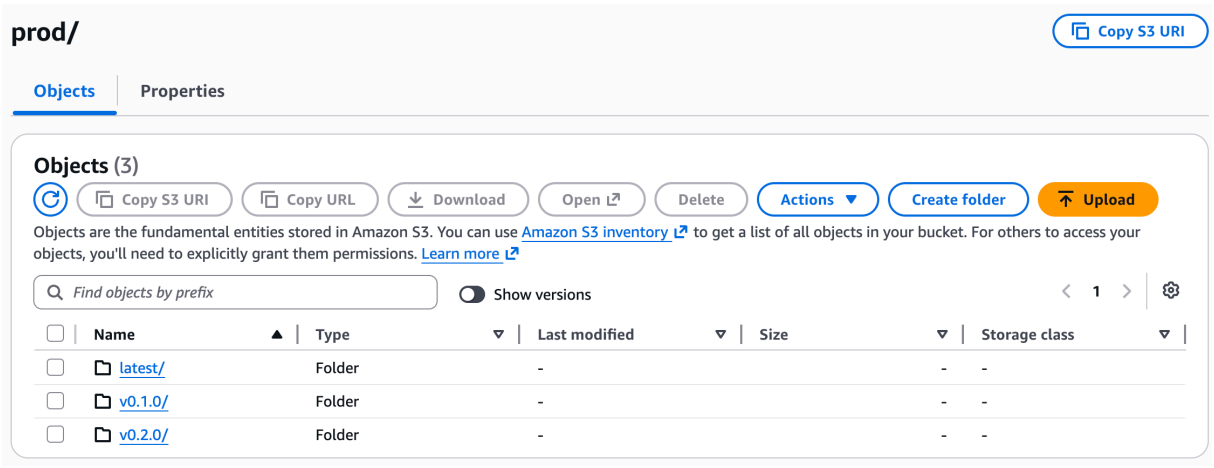

2.6 7.1.2.2.9.5 Multi-Version Lambda Deployment Architecture

2.6.1 Objective

The objective of this document is to outline options for storing multiple versioned artifacts in S3 and creating separate Lambda functions from them using Terraform. It also highlights the impact on our current GitHub pipeline, which today only handles a single latest build. Supporting multiple versions will require retrieving and processing multiple Git tags, adjusting artefact upload logic, and updating Terraform to deploy one Lambda per version.

2.6.2 Current setup

Our current deployment process supports only a single Lambda version at a time, but the S3 structure already contains multiple versioned artefacts. In the environment's folder of the S3 bucket, we have subfolders for each released api version, containing build artefacts.

The GitHub pipeline takes one tag as input, and that tag determines which existing folder in environment folder is used (for example, `v0.2.0`). The artefact from that selected folder is then

passed to Terraform, which creates or updates a single Lambda function based on that one version. Although multiple versioned folders already exist in S3, the current flow is designed around deploying only one chosen version at a time, not maintaining multiple Lambdas for different versions in parallel.

2.6.3 Approaches

2.6.3.1 Github deploy pipeline

Our current deployment pipeline takes only one tag as an input, which then determines what artefacts are used while creating a Lambda. Deployment job looks as below:

```
jobs:
  deploy-release:
    name: "Deploy to ${{ inputs.environment }}"
    permissions:
      id-token: write
      contents: read
      actions: read
    uses: ./.github/workflows/deploy-application-infrastructure.yaml
    with:
      environment: ${{ inputs.environment }}
      workspace: "default"
      stacks: "['triage']"
      tag: ${{ inputs.tag }}
      workflow_timeout: 30
      type: app
      Lambda_s3_path: "${{ inputs.environment == 'test' && format('staging/test/{0}/
Lambda_function.zip', inputs.tag) (...)
      cwlogs_s3_path: "${{ inputs.environment == 'test' && format('staging/test/{0}/
cwlogs_transformer.zip', inputs.tag) (...)
      cwmetrics_s3_path: "${{ inputs.environment == 'test' && format('staging/test/{0}/
cwmetrics_transformer.zip', inputs.tag) (...)
    secrets:
      ACCOUNT_ID: ${{ secrets.ACCOUNT_ID }}
      MGMT_ACCOUNT_ID: ${{ secrets.MGMT_ACCOUNT_ID }}
      BKP_ACCOUNT_ID: ${{ secrets.BKP_ACCOUNT_ID }}
      MSTEAMS_WEBHOOK: ${{ secrets.MSTEAMS_WEBHOOK }}
```

Propositions of approaches for handling artefacts:

1. Allow the pipeline to accept multiple tags at once. Instead of selecting only one version folder, the pipeline would receive a list of tags (e.g., `v1.0.0`, `v2.0.0`, `v3.0.0`) and pass all corresponding S3 artefact paths to Terraform. Terraform would then create multiple Lambda functions, one for each version.
    - **Pros**:
        - Ability to create Lambda for each specified version.

    - Required Lambdas can be created during one pipeline run.
  - **Cons:**
    - Complexity of github pipeline increases.
    - Github pipeline would need a lot of reworking .

2. The pipeline continues to accept one release tag (e.g., `v3.0.0`). That tag determines which artefact folder in S3 is used. Terraform then deploys the code to the existing Lambda function, publishes a new Lambda version, and creates a Lambda alias named after the tag. API Gateway stages can then be configured to invoke these aliases, allowing versioned API endpoints without creating multiple Lambda functions.
   - **Pros:**
     - Minimal or no pipeline changes, it already supports sending artefacts from one tag to Terraform.
   - **Cons:**
     - Only viable when aliases approach is investigated and approved.

2.6.3.2 Creating Lambda with Terraform

Currently Terraform does not create multiple Lambdas or aliases. It simply deploys the chosen version by updating the same Lambda function each time. Even though multiple versioned folders exist in S3, only the version specified by the pipeline input is used, and only one Lambda is ever deployed or updated per run. That means previously existing Lambda is deleted and new one takes their place. Current Terraform code handling creating apig Lambda:

```
module "apigLambda" {
  source          = "../../modules/Lambda"
  aws_region      = var.aws_region
  function_name   = "${local.resource_prefix}-apig-Lambda"
  policy_jsons    = [
    aws_iam_policy.s3_artefacts_access.policy,
    aws_iam_policy.ddb_read_access.policy,
    aws_iam_policy.Lambda_kms_access.policy
  ]
  handler         = "api_gateway_configurator.handler"
  runtime         = var.runtime
  s3_bucket_name = data.aws_s3_bucket.s3_artefacts.bucket
  s3_key          = var.Lambda_s3_path
  s3_key_version_id = data.aws_s3_object.s3_artefacts.version_id
  ignore_source_code_hash = false
  memory_size     = var.apig_mem_size
  kms_key_arn     = data.aws_kms_key.logs.arn
  cloudwatch_logs_kms_key_id = data.aws_kms_key.logs.arn
  description     = "Lambda function for API gateway processing event in SAET Triage
API"

  subnet_ids         = data.Terraform_remote_state.vpc.outputs.private_subnet_ids
```

```
  security_group_ids = [aws_security_group.triage_api_Lambda_security_group.id]
  vpc_id             = data.Terraform_remote_state.vpc.outputs.vpc_id

  environment_variables = {
    "ENVIRONMENT"         = var.environment
    "WORKSPACE"           = Terraform.workspace == "default" ? "" : Terraform.workspace
    "BODY_MAP_NODE_TABLE" = module.bodymaps.dynamodb_table_name
    "STARTING_NODE_TABLE" = module.starting_coords.dynamodb_table_name
    "TRIAGE_NODE_TABLE"   = module.triage_nodes.dynamodb_table_name
  }
  account_id = data.aws_caller_identity.current.account_id
}
```

Propositions of approaches handling multiple Lambdas creation:

Taking into account only approaches that require keeping Terraform to handle Lambda creation.

1. Terraform receives list of Lambda versions, all of them are created dynamically by involving `for each` operation. Example of minimal Lambda creation block using this approach:

```
module "apigLambda" {
  for_each = toset(var.versions)

  function_name = "${local.resource_prefix}-apig-Lambda-${each.key}"
  handler       = "api_gateway_configurator.handler"
  runtime       = "var.runtime"

  s3_bucket = var.bucket_name
  s3_key    = "prod/${each.key}/code.zip"
}
```

   - **Pros:**
     - Creating new Lambda is just adding another version into the list.
     - Clean Terraform code, keeping one module for every version.
     - Easy to maintain, no need of duplicate code.
   - **Cons:**
     - Requires passing a list of version by the pipeline, which makes pipeline more complex and involves a lot of work.
     - Every Lambda needs to have same definition variables.

2. Creating a separate module for each major version, for example `apigLambda-v1`, `apigLambda-v2`.
   - **Pros:**

    - Each Lambda version is clearly defined.
    - No dynamic logic.
  - **Cons:**
    - Requires adding each major Lambda version manually to Terraform code.
    - Repetitive resource blocks.
    - Grows quickly with each major version.

3. Alias-based approach, Terraform continues to deploy one Lambda function, but instead of creating multiple resources for different versions, it creates multiple Lambda aliases. The pipeline still takes one tag, and Terraform creates a Lambda alias named after the tag. This allows to expose versioned API endpoints without creating multiple Lambda functions.
   - **Pros:**
     - Minimal pipeline changes.
     - Keeping one Lambda resource, maintaining Terraform code clean.
   - **Cons:**
     - Requires Lambda aliases investigation and analysis.
     - Requires strategy for deleting old aliases when new one of this major version is released.

2.6.4 Conclusion

Aliases look like the strongest and simplest path forward, giving us versioned deployments without creating multiple Lambda functions. They keep the pipeline almost unchanged and integrate cleanly with API Gateway. However, we still need to analyse alias behaviour (how they map to published versions, how to manage old aliases, how to change Terraform code to support it) before fully committing to this approach.

2.7 7.1.2.2.9.6 - Routing a request to appropriate versioned lambda

2.7.1 Objective

The goal of this document is to explain how API Gateway can direct requests to different Lambda versions based on a header sent by the client. This allows users to control which version they want to call. The document outlines practical ways to set this up and highlights the strengths and limitations of each approach.

2.7.2 Approaches

API Gateway does not provide any built-in way to dynamically choose which Lambda function it invokes. It cannot switch Lambdas based on headers, query parameters, request bodies, or any other

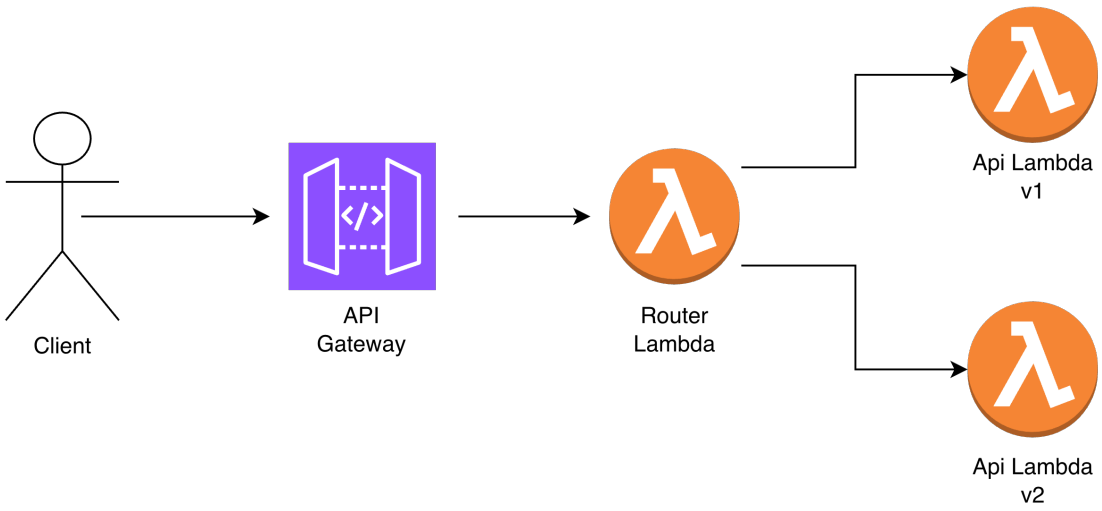

runtime data. Each API Gateway route must be wired to a single, fixed Lambda integration defined in Terraform.

2.7.2.1 Lambda Router (static mapping)

A single Lambda function acts as a router. API Gateway always invokes this router Lambda, which reads the `version` header and forwards the request to the correct Lambda version.

Flow:

1. Client sends request with `version` header.
2. API Gateway invokes the Lambda Router.
3. Lambda Router inspects the header.
4. Lambda router invokes the correct api Lambda version.

Simple Lambda Router code example:

```
import json
import boto3

client = boto3.client("lambda")

def handler(event, context):
    version = event.get("headers", {}).get("version")

    # Pick the target Lambda based on the version header
    if version == "v1":
        target = "lambda-v1"
    elif version == "v2":
        target = "lambda-v2"
```

```
    else:
        return {
            "statusCode": 400,
            "body": "Missing or invalid version header"
        }

    # Invoke the selected Lambda
    response = client.invoke(
        FunctionName=target,
        Payload=json.dumps(event)
    )

    # Return the downstream Lambda's response
    return json.loads(response["Payload"].read())
```

2.7.2.1.1 Pros:

- Simple
- Easy to maintain
- Very little impact on architecture costs

2.7.2.1.2 Cons:

- Static mapping requires updates for new versions.

2.7.2.2 Lambda Router (dynamic mapping)

This variation dynamically constructs the Lambda name based on the version header. If the header is `v3`, the router calls `lambda-v3` automatically.

Flow:

1. Client sends request with `version` header.
2. API Gateway invokes the Lambda Router.
3. Router invokes Lambda with version-based name (for example `lambda-{version}`).
4. If the Lambda exists, it runs.
5. If not, AWS returns a ResourceNotFoundException.

Very simple, dynamic code example:

```
import json
import boto3

client = boto3.client("lambda")
```

```
def handler(event, context):
    version = event.get("headers", {}).get("version")

    if not version:
        return {
            "statusCode": 400,
            "body": "Missing version header"
        }

    target = f"lambda-{version}"

    try:
        response = client.invoke(
            FunctionName=target,
            Payload=json.dumps(event)
        )
        return json.loads(response["Payload"].read())

    except client.exceptions.ResourceNotFoundException:
        return {
            "statusCode": 404,
            "body": f"Lambda function '{target}' not found"
        }
```

2.7.2.2.1 Pros:

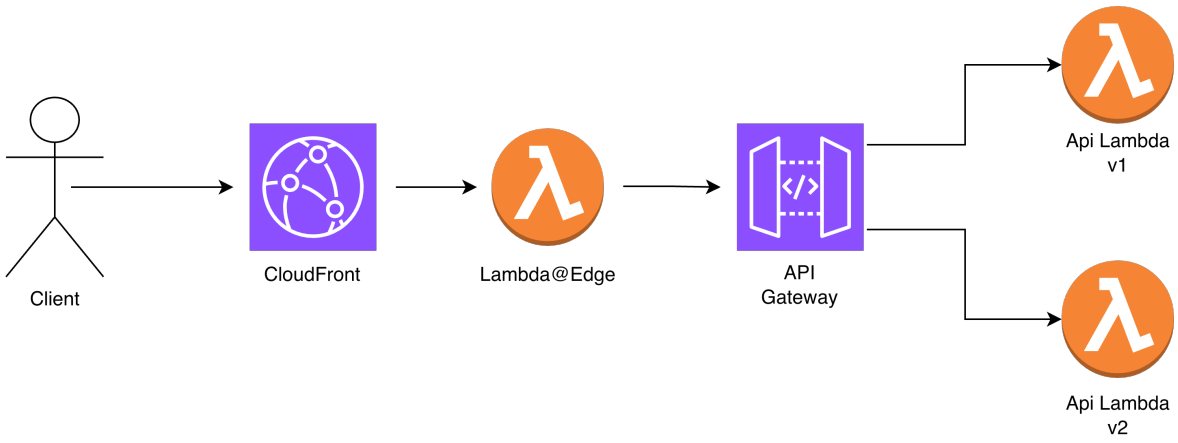

- Automatically supports unlimited versions
- No mappings to maintain
- Very little impact on architecture costs

2.7.2.2.2 Cons:

- Typos in headers will cause 404
- Requires consistent Lambda naming conventions

2.7.2.3 CloudFront + Lambda@Edge routing

CloudFront sits in front of API Gateway. Lambda@Edge rewrites the request path based on the `version` header. API Gateway then routes based on the rewritten path.

Simple code example:

```
def handler(event, context):
    request = event["Records"][0]["cf"]["request"]
    headers = request.get("headers", {})

    # Extract version header (case-insensitive)
    version = None
    if "version" in headers:
        version = headers["version"][0]["value"]

    # Rewrite URI based on version
    if version == "v1":
        request["uri"] = "/v1" + request["uri"]
    elif version == "v2":
        request["uri"] = "/v2" + request["uri"]
    else:
        # Default version
        request["uri"] = "/v1" + request["uri"]

    return request
```

2.7.2.3.1 Terraform

Using Lambda@Edge to rewrite the request path requires corresponding changes in Terraform. CloudFront can only rewrite the URI, API Gateway must already have matching resources and integrations for those rewritten paths. CloudFront distribution must forward the rewritten path to API

Gateway. All of this creates additional work in terraform for each major version and makes it much more complex.

2.7.2.3.2 Pros:

- Routing happens before API Gateway, which removes the need for a router Lambda
- Keeps API Gateway simple

2.7.2.3.3 Cons:

- Requires Terraform changes to API Gateway
- More infrastructure complexity - more costs
- No dynamic versioning
- Versioned API Gateway paths must be maintained

2.7.2.4 Header-based routing in API Gateway (HTTP API only)

This approach uses API Gateway HTTP API (v2) with a route selection expression to route incoming requests to different Lambda functions based on a request header (e.g., `version`). Unlike REST API, HTTP API supports routing based on headers.

Architecture:

- API Gateway HTTP API uses: `route_selection_expression = "$request.header.version"`
- Each version (v1, v2, …) is defined as a route key.
- Each route key is mapped to a different Lambda integration.
- Clients select the version by sending the appropriate header.

Example of routing resources in terraform:

```
resource "aws_apigatewayv2_api" "api" {
  name                       = "versioned-api"
  protocol_type              = "HTTP"
  route_selection_expression = "$request.header.X-Version"
}

resource "aws_apigatewayv2_integration" "v1" {
  api_id                 = aws_apigatewayv2_api.api.id
  integration_type       = "AWS_PROXY"
  integration_uri        = aws_lambda_function.v1.invoke_arn
}
```

```
resource "aws_apigatewayv2_integration" "v2" {
  api_id                 = aws_apigatewayv2_api.api.id
  integration_type       = "AWS_PROXY"
  integration_uri        = aws_lambda_function.v2.invoke_arn
}

resource "aws_apigatewayv2_route" "route_v1" {
  api_id    = aws_apigatewayv2_api.api.id
  route_key = "v1"
  target    = aws_apigatewayv2_integration.v1.id
}

resource "aws_apigatewayv2_route" "route_v2" {
  api_id    = aws_apigatewayv2_api.api.id
  route_key = "v2"
  target    = aws_apigatewayv2_integration.v2.id
}
```

2.7.2.4.1 Pros:

- Keeping everything in API Gateway
- No additional services needed
- Cheaper than REST API

2.7.2.4.2 Cons:

- Complete API Gateway rewrite to support HTTP API
- HTTP API has fewer features
- Each version requires adding resources to API Gateway

2.7.2.5 Conclusion

While the CloudFront + Lambda@Edge approach is technically viable, it introduces unnecessary complexity for a simple version-routing problem. It requires additional infrastructure and ongoing Terraform updates to maintain versioned API Gateway paths. This creates more operational overhead than value.

The Lambda Router approach is a better fit. It keeps all routing logic in one place, avoids CloudFront entirely, and is far easier to maintain as versions evolve. We can choose between a static router for predictable version mappings or a dynamic router that automatically routes to `lambda-vX` without Terraform changes. Both options are simpler, more flexible, and more future-proof than the CloudFront method.

Header-based API Gateway routing approach is clean, fast, and easy to extend. It avoids the need for a router Lambda and keeps the API surface unchanged, but it only works with HTTP API, not REST API, so adopting it means switching to HTTP API and verifying that none of existing REST-only features are required.
