Right to work: UK (ILR)

## SUMMARY

Senior Software Engineer specialising in Python backend systems, cloud architecture and multi-tenant SaaS platforms. Experienced in designing and delivering complex APIs, tenant isolation, authentication and authorisation, and production cloud infrastructure.
Led the architectural transition of an industrial analytics platform from a Django monolith to a decoupled Django Ninja API and Nuxt 4 frontend, taking ownership of architecture, multi-tenancy, RBAC, Azure hosting and CI/CD through production environments. Hands-on Nuxt 4 / Vue 3 / TypeScript for product UI (dashboards and widgets) as well as API contracts.

## SELECTED ACHIEVEMENTS

- **Platform architecture**: Led the migration of an industrial analytics platform from a Django monolith to a decoupled Django Ninja API and Nuxt 4 frontend – ~5 months in 2025 from plan to first hosted internal / pilot deployment in a production-typed environment.
- **Multi-tenant architecture**: Designed and implemented tenant isolation, RBAC, JWT-based authentication, tenant lifecycle (onboard / offboard / suspend), mixed global and tenant-specific resources, and tenant-scoped object storage on AWS S3. Designed fail-closed tenant scoping (no ambient tenant → empty queryset) and explicit confirmation for global resource creates, so shared platform resources can coexist with strict customer isolation without accidental cross-tenant or unintended global writes.
- **Backend engineering**: Sole backend lead for a configuration / tenancy API – ~103 endpoints (OpenAPI) across 8 first-party Django apps, supporting enterprise pilot work with industrial operators.
- **Cloud infrastructure**: Designed and delivered the Azure infrastructure underpinning independently deployable API and frontend services – VNet and subnets, PostgreSQL Flexible Server (TimescaleDB + PostGIS), Entra ID, Redis, Container Apps, App Service, Application Insights, secrets-managed environments, idempotent multi-environment automation, and CI/CD for both stacks through dedicated production data and compute.
- **Full-stack product delivery**: Shipped production-facing Nuxt 4 surfaces (dashboard navigation, configurable widgets / reports) alongside backend architecture and API ownership – not contracts-only frontend work.
- **Enterprise software delivery**: At HM Land Registry, independently owned two Flask services supporting regulated document generation; shipped a pilot to ~30 users before the platform expanded organisation-wide to hundreds–thousands of users.

## EXPERIENCE

### Klarian Ltd. - Exeter, UK – hybrid (typically ~fortnightly on-site; Plymouth-based).

***Senior Software Engineer*** - Aug 2023 – Oct 2026
***Senior Python Developer*** - Jun 2022 – Aug 2023

Industrial analytics / configuration platform: multi-tenant APIs, Azure-hosted compute and data plane, Nuxt 4 SPA, CI/CD for backend and frontend.

- Led the split of a Django monolith into a Django Ninja API and Nuxt 4 app: planning, tenancy model, auth, and ~5-month path in 2025 to first hosted release for internal and pilot stakeholders; followed with production hardening and feature delivery.
- Implemented multi-tenancy: tenant-scoped data, RBAC, JWT-aware auth, onboard/offboard/suspend, mixed global + tenant resources, tenant-scoped uploads on AWS S3; fail-closed managers when no tenant context is set.
- Backend ownership: design and delivery of REST-style APIs (Django Ninja), including enterprise sign-in (Microsoft / Entra) and auth/tenancy hardening; integration with data/analytics teams; legacy customer stack where required.
- Azure: authored automation for VNet, managed Postgres (extensions, Entra), Redis, Container Apps (API), App Service (frontend), observability; brought up production environments and CI/CD for both stacks; Docker-based deploys.
- Frontend: Nuxt 4, Vue 3, TypeScript, Pinia - delivered dashboard and widget/report product work; collaborated with senior FE on shared patterns and agent configuration.

**Stack:** Python, Django, Django Ninja, Nuxt 4, Vue 3, TypeScript, Azure, AWS S3, Docker, PostgreSQL, Redis, Git.

### HM Land Registry - UK

***Senior Software Developer*** - Dec 2020 – Jun 2022

- Delivered a **GDS-aligned Python/Flask** application replacing legacy internal tooling for regulated letter creation, with structured prompts guiding caseworkers.
- **Owned two Flask services:** web UI and an integration / document layer consuming a Java microservice API; ~50 Microsoft Word merge-style documents whose bodies contain Jinja2 markup for generated correspondence.
- Shipped **pilot** to **~30** internal users; platform later grew to hundreds–thousands of users organisation-wide.
- After contractor team lead left within the first year, owned both Flask Python codebases (web + integration services) end-to-end; mentored an apprentice who continued the work post-handover.

**Stack:** Python, Flask, JavaScript, AWS, Docker, OpenShift, PostgreSQL.

## SKILLS

**Backend:** Python, Django, Django Ninja, FastAPI, Flask, REST APIs, multi-tenancy, JWT / enterprise SSO
**Architecture:** Multi-tenancy, RBAC, API design, authentication and authorisation
**Frontend:** Nuxt 4, Vue 3, TypeScript, JavaScript, HTML, SCSS, Pinia
**Data:** PostgreSQL, TimescaleDB, PostGIS, Redis
**Cloud & platforms:** Azure (Container Apps, App Service, Postgres Flexible Server, VNet, Entra), AWS S3, Docker, Linux, CI/CD (GitHub Actions–style pipelines)
**Testing:** Pytest, pytest-django; unit and integration tests for APIs, auth and multi-tenancy; automated PR test runs (GitHub Actions)
**Engineering:** Mentoring, cross-functional delivery with product; AI-assisted development via IDE agent rules/skills (Cursor)
**Languages:** English (professional), Romanian (native)

## EDUCATION

**Plymouth City College, UK** – BTEC Level 3 Certificate in IT (Distinction*) – 2013-2014
**University Al. I. Cuza, Romania** – Faculty of IT (first year) – 1999-2000
**IT High School, Romania** – Diploma + IT certificate – 1995-1999

## INTERESTS

ESP32-C3 SuperMini, Home Assistant – home automation (lighting, water-level sensing).
